Proponent Declaration

Yara Pilbara Nitrates Pty Ltd is pleased to submit this Compliance Assessment Report as per condition 4-6 of Ministerial Statement 870.

I, Matthew Callanan, Acting Plant Manager declare that I am authorised on behalf of Yara Pilbara Nitrates Pty Ltd (being the person responsible for the proposal) to submit this form and that the information contained in this form is true and not misleading.

1 Introduction

1.1 Purpose

The purpose of the Compliance Assessment Report (CAR) is to annually assess compliance with all conditions of Ministerial Statement 870 (MS 870), issued on 7 July 2011, as per conditions 4-3, 4-4 and 4-6 of MS 870:

- "4-3 The proponent shall assess compliance with conditions in accordance with the compliance assessment plan required by condition 4-1.
- 4-4 The proponent shall retain reports of all compliance assessments described in the compliance assessment plan required by condition 4-1 and shall make those reports available when requested by the CEO.
- 4-6 The proponent shall submit to the CEO the first compliance assessment report fifteen months from the date of issue of this Statement addressing the twelve month period from the date of issue of this Statement and then annually from the date of submission of the first compliance report. The compliance assessment report shall:
 - 1. be endorsed by the proponent's Managing Director or a person delegated to sign on the Managing Director's behalf;
 - 2. include a statement as to whether the proponent has complied with the conditions;
 - 3. identify all potential non-compliances and describe corrective and preventative actions taken;
 - 4. be made publicly available in accordance with the approved compliance assessment plan; and
 - 5. indicate any proposed changes to the compliance assessment plan required by condition 4-1."

The annual CAR is prepared in accordance with the Compliance Assessment Plan (CAP) approved 23 August 2012; and is due to be submitted to the Department of Water and Environmental Regulation (DWER)¹ annually by 8 October.

1.2 Scope

This C

This CAR (hereinafter referred as "2017 CAR") applies to the Project being developed by Yara Pilbara Nitrates Pty Ltd (YPN) to construct and operate a Technical Ammonium Nitrate (TAN) Plant located on Lot 3017 within the Burrup Strategic Industrial Area on the Burrup Peninsula, Western Australia. The TAN Plant is located approximately 13 kilometres (km) north-west of Karratha.

Implementation of the Project is subject to the conditions of MS 870. YPN as the proponent must ensure implementation of MS 870 conditions. The 2017 CAR assesses compliance against the conditions for works carried out during the reporting period 8 July 2016 to 7 July 2017. The 2017 CAR is to be submitted to the DWER by 8 October 2017. This is the sixth CAR to be submitted for the TAN Plant.

Formerly submitted to the Office of the Environmental Protection Authority.

06-10-2017

600-200-CAR-YPN-0038

Rev C

Additionally the 2017 CAR provides information to DWER as requested in a letter dated 21 September 2017 in response to the compliance audit undertaken by DWER in August/September 2017.

1.3 Project Details

The TAN Plant will have a production capacity of 350,000 tonnes per annum (TPA) or 915 tonnes per day (TPD) of Technical Ammonium Nitrate (TAN). The project comprises three (3) major process units, each producing a separate product in the manufacturing process:

- Nitric Acid Plant to convert ammonia and atmospheric air into nitric acid (NA).
 The NA unit has a capacity of 760 TPD as 100% weight. The main feedstock, ammonia, shall be delivered from the adjacent ammonia plant.
- Ammonium Nitrate (AN) Solution Plant to convert ammonia and NA into AN solution. This AN wet section has a capacity of 965 TPD in balance with nitric acid production capacity.
- 3. TAN Plant to convert AN solution into TAN prills (final product). This is a dry section for production of TAN prills (0.7 and 0.8 kg/l density) with a capacity of 915 TPD. Surplus AN solution shall be sold as liquid.

The project also has storage, loading and transport facilities, including an incoming liquid ammonia pipeline, bulk and bagged TAN storage, bulk loading system, bagging unit and truck loading.

1.4 CAR Public Availability

This 2017 CAR is to be placed on the Yara website, or an equivalent website, for the life of the Project. Within seven (7) days of submission of the 2017 CAR to OEPA it shall be publically available at:

http://yara.com.au/about-yara/about-yara-local/yara-pilbara/nitrates/

A URL link to the report uploaded will be sent to the Compliance Branch through the compliance@epa.wa.gov.au email address.

1.5 CAP Changes

It was identified during the preparation of the 2016 CAR that as the TAN plant moves into operational phase it is appropriate to review the existing CAP. YPN commenced the initial review in the 2017 reporting period and intends to submit the revised CAP to DWER when completed.

06-10-2017 600-200-CAR-YPN-0038 Rev 0

2 Current Status

The Project continued commissioning during the reporting period (8 July 2016 to 7 July 2017) under DWER issued Works Approval W4701/2010/1. While some defects in the performance and start-up of some facilities were identified, these were corrected and did not have a bearing on the environmental performance of the Plant. Commissioning was completed on 15 September 2017 and a Commissioning Report was submitted to the DWER on 29 September 2017.

Environmental monitoring and reporting was completed by YPN during the reporting period. Operational control of the YPN site was handed over from the Engineering Procurement Construction (EPC) contractor to YPN on 29 March 2017. Under the terms of the EPC contract, resourcing environmental management and reporting were the responsibility of the contractor..

A Section 45C non-substantial change to the TAN Plant enabling additional storage of bagged TAN was approved on 7 June 2017. Consequently, Schedule 1 of MS870 was updated and is now consistent with contemporary EPA policy (specifically, *Environmental Assessment Guideline No. 1 – Defining the Key Characteristics of a Proposal*).

On 12 September 2017 the Federal Department of the Environment & Energy issued a variation of conditions to the EPBC Approval 2008/4546 under section 143(1)(a) of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act). YPN was advised of the variation via email on 13 September 2017.

06-10-2017 600-200-CAR-YPN-0038 Rev 0

3 Compliance

3.1 Statement of Compliance

The results of the assessment of compliance with MS870 are shown in Table 1.

A total of 27 items were assessed. The assessment found the following:

- 12 items were found as compliant:
- 8 items were found as completed;
- 4 items were found as not required at this stage; and
- 3 items was assessed as non-compliant.

Details of the following events which lead to the non-compliant items are contained within Section 3.4:

- Non-compliance #1 and #2 Failure to report groundwater results within seven (7) days (items M4-5 and M8-5); and,
- Non-compliance #3 Failure to fully implement air quality monitoring requirements (item M5-2).

In preparation of this 2017 CAR, YPN has referred to historic correspondence between YPN and various regulators that has been cited as evidence in previous CARs. Where YPN does not currently have the original or a copy of the evidence, but reference to the evidence has been previously made, the evidence has been flagged as "not sighted". A full list of "not sighted" evidence is provided within Section 5.

3.2 MS 870 Compliance Assessment

In assessing compliance the following definitions have been used:

Compliance Status Terms	Abbreviation	Definition
Compliant	С	Implementation of the proposal has been carried out in accordance with the requirements of the audit element.
Completed	CLD	A requirement with a finite period of application has been satisfactorily completed.
Not required at this stage	NR	The requirements of the audit element were not triggered during the reporting period.
Potentially non- compliant	PNC	Possible or likely failure to meet the requirements of the audit element.
Non-compliant	NC	Implementation of the proposal has not been carried out in accordance with the requirements of the audit element.

06-10-2017 600-200-CAR-YPN-0038

MS870 Compliance Assessment Audit Table Table 1

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M1-1	Proposal Implementation	The proponent shall implement the proposal as documented and described in schedule 1 of this statement subject to the conditions and procedures of this statement.	Implement the proposal according with Schedule 1 of Statement No. 870, including the key proposal characteristics.	CAR.	Min for Env		Overall	Ongoing	С	The Proposal has been implemented in accordance with all elements in Schedule 1 (see Table 2). In response to the request for verification from DWER dated 21 September 2017 an email from OEPA, dated 12 May 2017, confirmed the disturbance area from GIS files provided with the s45C application (Attachment 1) had reduced from 35 ha to 33.11 ha. The disturbance area is the area within the site fence and no additional disturbance has occurred.
870: M2-1	Proponent Nomination and Contact Details	The proponent for the time being nominated by the Minister for Environment under sections 38(6) or 38(7) of the Environmental Protection Act 1986 is responsible for the implementation of the proposal.	Notify in writing a letter that provides details of the name and address of the new proponent.	Proponent details as listed on MS 870.	Min for Env		Overall	Ongoing	С	The proponent contact details are Yara Pilbara Nitrates Pty Ltd (ACN 127 391 422), Level 5, 182 St Georges Terrace, Perth, WA 6000. As advised to OEPA and acknowledged on 15 November 2012 and 17 December 2012 respectively (not sighted).
870: M2-2	Proponent Nomination and Contact Details	The proponent shall notify the Chief Executive Officer of the Office of the Environmental Protection Authority (CEO) of any change of the name and address of the proponent for the serving of notices or other correspondence within 30 days of such change.	Notify in writing.	Letter of notification.	CEO		Overall	Within 30 days of such change	NR	No change within reporting period.
870: M3-1	Time Limit of Authorisation	The authorization to implement the proposal provided for in this statement shall lapse and be void five years after the date of this statement if the proposal to which this statement relates is not substantially commenced	Notify in writing.	Letter of notification.	CEO		Overall	Before 7 July 2016	CLD	Project commenced construction during November 2012 (letter notifying EPA of substantial commencement not sighted).
870: M3-2	Time Limit of Authorisation	The proponent shall provide the CEO with written evidence which demonstrates that the proposal has substantially commenced on or before the expiration of five years from the date of this statement.	Notify in writing.	Letter of notification.	CEO		Overall	Before 7 July 2016	CLD	Project commenced construction during November 2012 (letter notifying EPA of substantial commencement not sighted).
870: M4-1	Compliance Reporting	The proponent shall prepare and maintain a compliance assessment plan to the satisfaction of the CEO.	Prepare and maintain a CAP and an audit table in accordance with the 'Post Assessment Guideline for Preparing an Audit Table'. Written Correspondence.	Approved CAP. Approved Audit Table-A copy of Corresponde nce to CEO.	CEO		Overall	Ongoing	С	TAN Plant Compliance Assessment Plan (MS 870) (CAP) rev. 01 was submitted on 9 August 2012. The OEPA approved the CAP in a letter dated 23 August 2012 (Attachment 4A). YPN initiated a review of the CAP in the 2016 reporting period but is yet to be completed.
870: M4-2	Compliance Reporting	The proponent shall submit to the CEO the compliance assessment plan required by condition 4-1 at least 6 months prior to the first compliance report required by condition 4-6, or prior to implementation, whichever is sooner. The compliance assessment plan shall indicate: 1. the frequency of compliance reporting; 2. the approach and timing of compliance assessments; 3. the retention of compliance assessments; 4. the method of reporting of potential non-compliances and corrective actions taken; 5. the table of contents of compliance assessment reports; and 6. public availability of compliance assessment reports.	Submit the CAP to CEO. The CAP includes: 1. frequency of CAR, 2.approach and timing, 3.retention, methods of non- compliances and corrective actions reporting, 5. Table of contents of CAR and 6. Public availability of CAR.	Approved CAP. A copy of Corresponde nce to CEO. Available on proponent's website.	CEO		Pre- construction	Six (6) months prior to the first CAR by condition 4-6 (by 8 April 2012) or prior to implementati on, whichever is sooner	CLD	TAN Plant Compliance Assessment Plan (MS 870) (CAP) was submitted on 9 August 2012. The OEPA approved the CAP in a letter dated 23 August 2012 (Attachment 4A).

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M4-3	Compliance Reporting	The proponent shall assess compliance with conditions in accordance with the compliance assessment plan required by condition 4-1.	Undertake assessment according to the approved CAP.	CAR.	Min for Env		Overall	CAR annually by 8 October	С	Compliance has been assessed annually, as evidenced by annual CARs.
870: M4-4	Compliance Reporting	The proponent shall retain reports of all compliance assessments described in the compliance assessment plan required by condition 4-1 and shall make those reports available when requested by the CEO.	Retain electronic and hardcopies of Compliance Assessment Reports for the life of the Project, maintained as per PROPOSAL's Document Control Management System requirements being retrieved if required.	CAR and records availability at the request of CEO	CEO		Overall	When required by CEO	С	Annual CARs are retained by YPN and are available on http://www.yara.com.au/about-yara/about-yara-local/yara-pilbara/nitrates/
870: M4-5	Compliance Reporting	The proponent shall advise the CEO of any potential non-compliance within seven days of that non-compliance being known.	Notify in writing.	A copy of corresponde nce to CEO.	CEO		Overall	Within 7 days of non- compliance being known	NC	YPN advised OEPA of an exceedance of groundwater trigger values on 6 December 2016 (Attachment 4B). Exceedance was reported within seven days after receiving results on 29 November 2016. YPN advised OEPA on 3 April 2017 that groundwater monitoring undertaken on 15 March 2017 identified exceedance of trigger values. Exceedance was reported beyond the seven (7) days after receiving results on 24 March 2017 (Attachment 4C), as described in
870: M4-6	Compliance Reporting	The proponent shall submit to the CEO the first compliance assessment report fifteen months from the date of issue of this Statement addressing the twelve month period from the date of issue of this Statement and then annually from the date of submission of the first compliance report. The compliance assessment report shall: 1. be endorsed by the proponent's Managing Director or a person delegated to sign on the Managing Director's behalf; 2. include a statement as to whether the proponent has complied with the conditions; 3. identify all potential noncompliances and describe corrective and preventative actions taken; 4. be made publicly available in accordance with the approved compliance assessment plan; and 5. indicate any proposed changes to the compliance assessment plan required by condition 4-1.	Submit the CAR to CEO in accordance with CAP. The CAR shall: 1. be endorsed by the proponent's Managing Director or a person delegated; 2. include a statement of compliance with conditions; 3. identify all potential noncompliances and describe corrective measures; 4. Be made publicly available; and 5. Proposed changes.	CAR. Uploaded on to proponent's website. A copy of Corresponde nce to CEO.	CEO		Overall	The first CAR due to be submitted 8 October 2012. Then, annually on or before 8 October each year.	С	During construction phase, CARs were prepared by the engineering, procurement and construction contractor and have been submitted annually on behalf of YPN; CAR 2012 was submitted to OEPA on 10 October 2012, (not sighted) CAR 2013 was submitted on 13 November 2013 (Attachment 4D) CAR 2014 was submitted on 26 September 2014 (Attachment 4E) CAR 2015 was submitted on 4 March 2016 (Attachment 4F). CAR 2016 was submitted on 6 October 2016 (Attachment 4G). The 2017 CAR will be submitted to DWER on or before 8 October 2017. Environmental reporting was completed by YPN during the reporting period. Operational control of the YPN site was handed over from the EPC contractor to YPN on 29 March 2017. Under the terms of the EPC contract, resourcing environmental management and reporting were the responsibility of the contractor. However, due to deficiencies in this arrangement YPN assumed responsibility for these functions in mid-2016. CARs are endorsed by the YPN Plant Manager, include a statement of compliance, are retained by YPN and are available on http://www.yara.com.au/about-yara/about-yara-local/yara-pilbara/nitrates/

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M5-1	Air Quality	The proponent shall adopt and implement best practice pollution control technology as determined by the Chief Executive Officer of the Department of Environment and Conservation (DEC) on advice of the CEO to minimise all relevant emissions from the TAN Plant Ammonium Nitrate Prilling Plant.	Adopt and implement EFMA - Best Available Techniques for Pollution Prevention and Control in the European Fertilizer Industry, Booklet No. 6 of 8: Production of Ammonium Nitrate and Calcium Ammonium Nitrate, 2000 (EFMA, 2000b) from the Common Stack (other sources) for the AN Plant. DEC to incorporate stack emission concentration figures in the Works Approval and Licence that are commensurate with the use of best practice pollution control technology. Air Dispersion Modelling Study. Operation Air Quality and Monitoring Management (OAQMM) Plan for MINISTER approval. Written correspondence.	CAR. Air Dispersion Modeling Study. Air Quality reports, monitoring records. A copy of Corresponde nce to CEO/DEC	DEC	CEO	Overall	Ongoing	С	TAN Plant Air Quality Management Plan Doc. No. 0086269 February 2013 and submission on best practice pollution technology was reviewed by the OEPA and is considered to address relevant conditions (Attachment 5A).
870: M5-2	Air Quality	Prior to construction, the proponent shall prepare and implement an ambient air monitoring programme to the satisfaction of the CEO on the advice of the Chief Executive Officer of the DEC	Prepare a Construction/Operation Air Quality and Monitoring Management (AQMM) Plan for Minister approval. Implement the AQMM Plan. Written correspondence.	CAR. Air Quality report. A copy of Corresponde nce to CEO/DEC.	CEO	DEC	Overall	Ongoing	NC	TAN Plant Air Quality Management Plan (AQMP) Doc. No. 0086269 February 2013 was reviewed by the OEPA and is considered to address relevant conditions (Attachment 5A). Within this reporting period, a request for variation to the implementation of the AQMP was approved by OEPA on 22 December 2016 (Attachments 5B and 5C). The variation permitted that future air quality monitoring was to be carried out as described within the "Operational Monitoring" section in the approved Plan. It is intended that the AQMP will be reviewed and revised upon issuance of the Operating Licence. Air quality monitoring was not effectively implemented during the reporting period, as described in Section 0 and Section 4.1.

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M6-1	Rehabilitation	The proponent shall undertake rehabilitation to achieve the following outcomes: 1. The project area shall be non-polluting and shall be constructed so that its final shape, stability, surface drainage, resistance to erosion and ability to support local native vegetation are comparable to natural landforms within the local area, as demonstrated by a methodology acceptable to the CEO; 2. Native vegetation areas disturbed through implementation of the proposal, shall be progressively rehabilitated with vegetation composed of Plant species native to the Burrup Peninsula from propagating material of local provenance (as agreed by the CEO in consultation with the DEC); 3. Areas not currently supporting native vegetation shall be rehabilitated to the original land use or a use approved by the CEO; 4. The percentage cover of living vegetation in all rehabilitation areas shall be comparable with that of nearby undisturbed land as demonstrated by a methodology acceptable to the CEO; 5. No new species of weeds (including both declared weeds and environmental weeds) shall be introduced into the area as a result of the implementation of the proposal; and 6. The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring undertaken prior to the commencement of operations, or exceed that existent on comparable, nearby land which has not been disturbed during implementation of the proposal.	Prepare a Construction Terrestrial Vegetation and Flora Management (CTVFM) Plan for MINISTER approval. Implement the CTVFM Plan. Prepare a Construction Weed Management (CWM) Plan for MINISTER approval. Implement the CWM Plan. Written correspondence.	CAR. Construction rehabilitation reports and inspection records. A copy of Corresponde nce to CEO/DEC.	CEO	DEC	Overall	Ongoing	С	No progressive rehabilitation has been undertaken at the TAN Plant to date and at this stage, as all disturbed areas remain in use, no rehabilitation activities are planned. YPN continue to assess land use onsite and where opportunities exit to progressively rehabilitate this will be done in accordance with the CTVFM. Preventative weed controls have been implemented in accordance with the Construction Weed Management Plan. In addition, weed surveys were conducted by an independent botanist in December 2016 and April 2017. The January report was submitted to DWER on 31 January 2017 (Attachment 6A). The second survey was undertaken following rain in January and February (Attachment 6B). One new weed (two plants) was recorded in the April 2017 survey. These plants were removed. Ongoing weed surveys will be conducted to verify effectiveness of weed management and presence of new species.
870: M6-2	Rehabilitation	Rehabilitation activities shall continue until such time as the requirements of condition 6-1 are demonstrated by inspections and reports to have been met for a minimum of five years, to the satisfaction of the CEO on advice of the DEC.	Prepare an Operation Terrestrial Vegetation and Flora Management (OTVFM) Plan for MINISTER approval. Implement the OCTVFM Plan. Prepare an Operation Weed Management (OWMP) Plan for MINISTER approval. Implement the OWM Plan. Written Correspondence.	CAR. Operation rehabilitation reports and inspection records. A copy of Corresponde nce to CEO/DEC.	CEO	DEC	Post- decommissio ning	Until such time as the requirements of condition 6-1 are demonstrate d by inspections and reports to have been met for a minimum of five years.	NR	No progressive rehabilitation has been undertaken at the TAN Plant to date and at this stage, as all disturbed areas remain in use, no rehabilitation activities are planned. YPN continue to assess land use onsite and where opportunities exit to progressively rehabilitate this will be done in accordance with the CTVFM
870: M7-1	Fauna	The proponent shall employ such structures and apparatus as are necessary and agreed by the DEC to deter birds from entering the contaminated water pond, clean water pond, and sewage wastewater treatment station evaporation pond	Employ structures and apparatus to deter birds from entering the contaminated and clean ponds. Seek advice from DEC.	CAR. A copy of Corresponde nce to DEC/CEO.	CEO	DEC	Overall	Ongoing	С	Bird deterrent systems were assessed and the preferred option agreed by Department of Parks and Wildlife as appropriate for the site (Attachment 7A). Bird deterrent wires have been installed over contaminated water ponds, clean water ponds, and sewage wastewater treatment evaporation pond, as described in the Bird Deterrent Systems Assessment Report (Attachment 7B). (see also photograph – Attachment 7C)

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M7-2	Fauna	During construction of the TAN Plant the proponent shall ensure that the following requirements are met: 1. Fauna refuges are to be placed in the trenches and other construction related voids at intervals not exceeding 50 metres; 2. The proponent shall employ at least two "faunaclearing people" that are appropriately licensed by the DEC to remove fauna from the trenches and other construction related voids; 3. Inspection and clearing of fauna from trenches and other construction related voids by fauna clearing people shall occur at least twice daily and not more than half an hour prior to backfilling of trenches and other construction related voids, with the first daily inspection and clearing to be completed no later than 3.5 hours after sunrise, and the second inspection and clearing to undertaken daily between the hours of 3:00 pm and 6:00 pm; 4. In the event of rainfall, the proponent shall, following the clearing of fauna from the trenches and other construction related voids, pump out any pooled water in the open trenches and other construction related voids (with the exception of groundwater) and discharge it via a mesh (to dissipate energy) to adjacent vegetated area, having regard for the DEC's draft guideline on the treatment and management of acid sulfate soils and water in acid sulfate soil landscapes (DEC, 2009) and any subsequent revisions; and 5. Within 14 days following completion of the construction activities requiring the use of open trenches and other construction related voids, the proponent shall provide a report on fauna found, both dead and alive, within the TAN Plant site boundary to the CEO.	Implement the Construction Terrestrial Fauna Management (CTFM) Plan for MINISTER approval. Report on Fauna Found.	CAR. Construction Fauna Found reports. Trench Inspections reports.	CEO	DEC	Pre-construction Construction	Ongoing Fauna Found Report Within 14 days	CLD	Construction was completed in February 2016, outside of this reporting period. No further construction works were conducted that resulted in excavation of trenches or construction-related voids. In response to the request for verification from DWER dated 21 September 2017 Attachment 7D is an extract from 6-monthly compliance reports of the fauna found at the TAN Plant during construction (February 2013 to December 2015).
870: M8-1	Groundwater	The proponent shall undertake detailed hydrogeological studies commencing at least 12 months prior to the commencement of construction to quantify groundwater quality, groundwater flow directions, and the depth to groundwater beneath the TAN Plant site and in surrounding areas.	Undertake Hydrogeological Studies.	Hydrogeolog ical studies Report.	CEO		Pre- construction	Ongoing	CLD	Hydrogeological and Hydrological Investigation was prepared by Environmental Resources Management (ERM) and issued in September 2011 (not sighted). Attachment 8A is a copy of the Hydrogeological and Hydrological Investigation report dated June 2012.
870: M8-2	Groundwater	The proponent shall develop appropriate management measures for dewatering to the satisfaction of the CEO on advice of the DEC and the Department of Water in the event that the information gathered from the hydrogeological studies required by condition 8-1 indicates that dewatering would be required during construction	Prepare the Construction Water Quality Management Plan for MINISTER approval, including if required, dewatering management. Written correspondence.	CAR. Groundwater reports. A copy of corresponde nce.	CEO	DEC DoW	Pre- construction	Ongoing	CLD	The Project commenced commissioning in February 2016 and continued commissioning during the reporting period. Consequently no construction activities required dewatering. Furthermore, there are no further construction activities planned which would require groundwater dewatering.

Audit Code	Subject	Action	How	Evidence	Satisfy	Advice	Phase	When	Status	Further Information / Verification October 2017
870: M8-3	Groundwater	The proponent shall design, construct, and locate groundwater monitoring bores to the satisfaction of the CEO on advice of the DEC and the Department of Water, having regard for the outcomes of the hydrogeological studies required by condition 8-1 and the Department of Water's Water Quality Protection Note 30 on Groundwater Monitoring Bores.	Prepare and implement Water Quality Management Plan for MINISTER approval, including groundwater monitoring. Written correspondence.	CAR. Groundwater monitoring report.	CEO	DEC DoW	Overall	After outcomes of the hydrogeologi cal studies	С	The Hydrogeological and Hydrological Investigation report contains the original bore installation records (Attachment 8A). Due to Construction and decommissioning activities, wells MW1 and MW4 were affected and two replacement bores were drilled on the 7 September 2013 by GHD. The rationale for the location of the new bores is explained in the Groundwater Monitoring Well Re-location Report provided by ERM, 14 February 2014 (Attachment 8B). An additional bore up-gradient of MW1 was installed in April 2017. The CEO was informed of the installation via letter in January 2017 (Attachment 8C).
870: M8-4	Groundwater	The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.	Implement Water Quality Management Plan, including groundwater monitoring.	CAR. Groundwater reports, records.	CEO		Overall	Every six months	С	During the reporting period groundwater monitoring was conducted twice, in November 2016 and March 2017. Both sets of results were compared and reported against to the groundwater monitoring trigger values. The 22 November 2016 sampling results were reported to the OEPA on 6 December 2016 (Attachment 8D.1 and 8D.2). The 15 March 2017 sampling results were reported to the OEPA on 3 April 2017 (Attachment 8D.3 and 8D.4). Future reporting will include results from a new bore up-gradient of the MW1 to represent offsite groundwater quality.
870: M8-5	Groundwater	In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels: 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified; 2. The proponent shall provide evidence which allows determination of the cause of the exceedance; 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO; 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.	Implement Water Quality Management Plan, including groundwater monitoring. Written correspondence.	CAR. Groundwater monitoring report, records. A copy of corresponde nce to CEO advising of any exceedance. A copy of corresponde nce to CEO submitting remedial action taken.	CEO		Overall	Within 7 days of the exceedance. Monitoring results biannually, or a frequency defined by CEO	NC	Groundwater monitoring was conducted on 22 November 2016, and reported to the OEPA on 6 December 2016 (see Attachment 8D.1 and 8D.2). Groundwater monitoring was conducted on 15 March 2017 and results were received on 24 March 2017. The exceedance report dated 3 April 2017 was not submitted within seven (7) days after receiving results (Attachment 8E.1 and 8E.2), as described in Section 3.4.1 and Section 4.2.
870: M8-6	Groundwater	The proponent shall make the monitoring reports required by condition 8-5(5) publicly available in a manner approved by the CEO	Seek approval from CEO for the monitoring reports.	Monitoring reports publicly available as indicated by CEO. A copy of corresponde nce to CEO.	CEO		Overall	Biannually, or a frequency defined by CEO	С	Groundwater Monitoring Reports for the monitoring period are publically available at http://yara.com.au/about-yara/about-yara-local/yara-pilbara/nitrates/ .

3.3 Schedule 1 Compliance Assessment

Schedule 1 of MS870 provides a description of the approved TAN Plant and includes a summary of key proposal characteristics. The Schedule was modified via a Section 45C change to the proposal on 7 June 2017. Modifications made to the Compliance Assessment of Key Characteristics Table (as shown in Table 2) were:

- decrease the development envelope (area of project lease) from 79 to 48.77 hectares (ha);
- decrease the disturbance footprint from 35 to 33.11 ha;
- remove bagged and bulk TAN storage capacity; and
- update figures 1 and 2 and delineation coordinates.

Condition 1.1 of MS870 (Audit Code, 870:M1.1) requires that the TAN Plant shall be implemented as documented and described in Schedule 1 of MS870. Table 2 documents the assessment of compliance against the key characteristics of the TAN Plant.

Table 2 Compliance Assessment of Key Characteristics

Requirement		Status	Further Information
The proponent shall implement the proposal as documented and described in schedule 1 of this statement subject to the conditions and procedures of this statement.		С	The proposal has been implemented in accordance with all elements of Schedule 1.
Element	Authorised Extent		
General			
Technical ammonium nitrate production facility (TAN Plant) capacity	350,000 tonnes of technical ammonium nitrate (TAN) per annum.	С	
Development Envelope	48.77 ha	С	Lease and TAN Plant boundary updated to reflect the size and area of Lot 3017 within the Burrup Industrial Estate.
Disturbance Footprint	33.11 ha	С	Area of disturbance revised to reflect the area disturbed within the Project lease, ie 33.11 ha. Email from OEPA, dated 12 May 2017, confirms the disturbance area from GIS files provided with the s45C application (Attachment 1) had reduced from 35 ha to 33.11 ha.
Main Process Units			
Nitric acid Plant	Capacity – 760 tonnes per day.	С	
Ammonium nitrate solution Plant	Capacity – 965 tonnes per day.	С

06-10-2017

600-200-CAR-YPN-0038

Rev 0

What was the cause(s) of the non-compliance or potential non-compliance?

Due to the change in the air emissions risk profile of the site and the extended duration of the construction phase, ambient air quality monitoring equipment was not adequately maintained or serviced during the period and consequently did not adequately perform.

As a consequence of the "campaign" style commissioning activities causing difficulties in scheduling external stack testers and the nitric acid storage tanks being under repair for the majority of the reporting period, testing of the nitric acid tank headspace was not undertaking in the reporting period.

What remedial and/or corrective action(s), if any, were taken or are proposed to be taken in response to the non-compliance or potential non-compliance?

YPN engaged an air quality expert to review the ambient air quality monitoring requirements in November 2016. This review has been used to consider the monitoring undertaken, including equipment and will be used to amend the AQMP. YPN intend to submit the revised AQMP to DWER for approval, following issuance of the operating licence by DWER. In addition, since January 2017, YPN has hired the equipment required to undertake the monitoring and are in the process of purchasing same equipment from a suitable vendor.

YPN have scheduled to complete the headspace testing as early as practical within the next reporting period. In the interim YPN process engineers are developing a calculated model of these emissions that can be verified during the headspace testing by the external stack testers. It should be noted that filters on the nitric acid tank vents are in place to manage any emissions from the tank headspace.

What measures, if any, were in place to prevent the non-compliance or potential non-compliance before it occurred? What, if any, amendments have been made to those measures to prevent re-occurrence?

Yara environmental personnel now have direct control and accountability for the ambient air quality monitoring at the TAN Plant. Construction related dust impacts are no longer a major risk for the site and the focus is on implementing the operational phase ambient air monitoring to ensure that production related emissions to air are managed and minimised.

4 Environmental Monitoring

During the reporting period the following environmental monitoring is required to be implemented to meet MS870:

- Ambient air monitoring (as required by condition 5-2); and
- Groundwater monitoring (as required by condition 8-4)

4.1 Air Monitoring

Condition 5-2 of MS870 requires that YPN develops and implements an ambient air monitoring programme to the satisfaction of the CEO on the advice of the Chief Executive Officer of the DEC.

The ambient air monitoring program for the TAN Plant is described within the TAN Plant Air Quality Management Plan (February 2013). OEPA advised on 18 March 2013 that this plan adequately addresses Condition 5-2 of MS870.

A request for variation to the implementation of the AQMP was approved by OEPA on 22 December 2016 (Attachments 5B and 5C). The variation permitted that future air quality monitoring within this reporting period, was to be carried out as described within the "Operational Monitoring" section in the approved Plan.

This request for variation to implementation of the AQMP was made as the TAN Plant had transitioned from the construction phase into the commissioning phase in February 2016 which resulted in an air emission profile that resembled an operational phase rather than construction phase. That is, emissions moved from dust generated during earthworks, open areas and unsealed roads during construction, to a phase where the site is sealed and potential for dust emissions are minimal, into start-up and operations phase where the air emissions profile is characterised by emissions of gas streams through stacks from the production processes.

Construction was completed in February 2016 and therefore monitoring during the reporting period was to adhere to the operational phase monitoring requirements. As such, Sections 4.1.1 to 4.1.4 only refer to monitoring conducted within the "operational" phase.

4.1.1 Monitoring Programme

The AQMP describes the monitoring to be undertaken during the operational phase (Table 3, Table 4 and Table 5).

Type of Monitoring	Monitoring Location	Monitoring Frequency	Monitoring Equipment	Performance
Dust deposition	Site 5, Site 6 & Site 7		Deposition gauge (AS/NZS 3580.10.1:2003)	Dust deposition gauges (DDG) were deployed at the three (3) off-site locations from September 2013. The insoluble fraction only was reported until the cessation of CSIRO monitoring in June 2016. Following the review of the ambient air quality monitoring, the DDGs were redeployed at all three (3) sites in March 2017.
NH ₃	Site 5, Site 6 & Site 7		NH₃ diffusion tubes	Sampling commenced in September 2013 using
NO _x	Site 5, Site 6 & Site 7		NO _x diffusion tubes	samplers provided by the CSIRO. In June 2016, CSIRO
SO _x	Site 5, Site 6 & Site 7		SO _x diffusion tubes	advised that they could no longer support the monitoring. YPN then sought an alternative passive sampling technology and the Radiello® samplers were found to be suitable for monitoring of NH ₃ , NO ₂ and SO ₂ . The first Radiello® samplers were deployed in September 2016.

The Baseline Report submitted to the DEE on 16 June 2017 (Attachment 13) provides details on the effectiveness of the implementation of the AQMP.

4.1.3 Monitoring Results

The 15 minute averages from the continuous emission monitoring system (CEMS) of the nitric acid stack during the reporting period are presented in Attachment 11.

The monthly point source air emission monitoring results from the ammonium nitrate stack (referred to as the Common Stack in the TAN Plant Works Approval) during the reporting period are presented in Table 7.

Notes:

4.1.4 Discussion of Results

All monthly stack testing monitoring results from the Nitric Acid Stack were below the targets. The continuous monitoring results revealed that the emissions of NOx and NH₃ from the Nitric Acid Plant reduced during commissioning through process improvements and optimisation. The emissions data indicates that the TAN Plant is substantially achieving emissions below the targets and functioning according to design.

The monthly point source air emission monitoring results from the ammonium nitrate stack (referred to as the Common Stack in the TAN Plant Works Approval) were consistently below the Works Approval targets for NH₃ and particulates.

YPN have scheduled to complete the headspace testing as early as practical within the next reporting period. In the interim YPN process engineers are developing a calculated model of these emissions that can be verified during the headspace testing by the external stack testers. It should be noted that filters on the nitric acid tank vents are in place to manage any emissions from the tank headspace.

YPN have engaged an air quality expert to analyse the ambient air quality (rock art) monitoring data collected. This analysis has been used to review the monitoring undertaken, including equipment and will be used to amend the AQMP. YPN will submit the revised AQMP to DWER for approval, following issuance of the operating licence by DWER.

^{1.} Issue with the analysis of the insoluble fraction and the results obtained were invalid. As total solids is a calculated parameter involving insoluble solids, it is not possible to report total solids.

06-10-2017 600-200-CAR-YPN-0038 Rev 0

4.2 Groundwater Monitoring

Conditions 8-3, 8-4 and 8-5 of MS870 requires that YPN undertakes groundwater monitoring and evaluates results against trigger levels.

870:M8-3 Groundwater The proponent shall design, construct, and locate groundwater monitoring bores to the satisfaction of the CEO on advice of the DEC and the Department of Water, having regard for the outcomes of the hydrogeological studies required by condition 8-1 and the Department of Water's Water Quality Protection Note 30 on Groundwater Monitoring Bores.

870:M8-4 Groundwater The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.

870:M8-5 Groundwater In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels:

- 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified;
- 2. The proponent shall provide evidence which allows determination of the cause of the exceedance;
- 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO;
- 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and
- 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.

4.2.1 Monitoring Programme

The groundwater monitoring programme developed to meet the MS870 requirements is currently defined in the TAN Plant Construction Environmental Management Plan – Water Quality Management Plan (Doc No: 2-250-329-PRO-TRE-0111-att02, Rev: 01). A draft Operational Groundwater Monitoring Procedure (OGMP) was included in the Commissioning Report submitted to DWER on 29 September 2017. It is intended that the OGMP supersede the aforementioned Water Quality Management Plan.

Five (5) groundwater monitoring wells (MW1-MW5) have been installed across the site. A sixth TAN Plant bore (Upstream Bore – US1) was installed in April 2017 and will be reported in future Compliance Assessment Reports.

06-10-2017 600-200-CAR-YPN-0038 Rev

Routine six (6) monthly water level gauging and water quality monitoring was undertaken at these monitoring wells in November 2016 and March 2017.

Monitoring is undertaken in accordance with a Standard Operating Procedure. Samples are collected in sample bottles in accordance with directions from the NATA-registered laboratory undertaking the analysis. Samples are analysed for the suite of parameters listed in Table 10.

Groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations were obtained from the hydrogeological studies required by Condition 8-1. Three (3) rounds of groundwater monitoring was completed as part of the hydrogeological study completed by ERM (2012). The baseline data collected to date was used to calculate the amended monitoring bore specific trigger levels as proposed in the draft OGMP. The methodology for calculating the monitoring bore specific trigger levels involved using the maximum concentration of an analyte detected plus 10%.

Table 10 Groundwater Monitoring Parameters and Trigger Levels as per the Construction Environmental Management Plan

Analyte	Units	Trigger Level (construction only)
рН	pH Units	6 – 8.4
Total Dissolved Solids	mg/L	143,000

Analyte	Units	Trigger Level
Analyte	Units	(construction only)

- . NA Not Available. There are a number of metals for which results have shown concentrations below the laboratory detection limits (Arsenic, Cadmium, Copper, Chromium, Lead and Nickel), and so a reliable trigger level has not been able to be determined at this stage.
- 2. Trigger Level based on IECA (2008)

4.2.2 Monitoring Performance

During the reporting period sampling was conducted during November 2016 and March 2017. During both monitoring events samples were analysed for the full suite of parameters listed in Table 10.

4.2.3 Monitoring Results

Results of groundwater monitoring at the TAN Plant during the reporting period is included in Table 11.

4.2.4 Discussion of Results

TAN Plant groundwater monitoring results to date continue to demonstrate variability in the groundwater chemistry with no clear trends for most parameters, excluding nitrate and total nitrogen.

In regard to nitrate and total nitrogen, these parameters have demonstrated the commencement of an uptrend in the last round of monitoring in most bores. This uptrend is attributable to the unplanned releases of solution containing ammonium nitrate to ground in proximity to MW2, MW4 and MW5 bores.

Each of the unplanned releases constituted reportable emissions under Section 72 of the *Environmental Protection Act* (a discharge of waste likely to cause pollution). Yara notified the DWER of the events on 31 March and 21 July 2017. Ongoing groundwater monitoring and investigation into the impact of the releases are currently being finalised. Findings and proposed remedial actions will be provided to the DWER upon finalisation of the investigation.

Subject: RE: Ministerial Statement 870 - s45C Change to Proposal (TAN Storage and

Development Envelope) - Additional Information Request

Hi Susan,

I am currently progressing Yara Pilbara Nitrates Pty Ltd's section 45C of the *Environmental Protection Act 1986* application and have identified the proposed revised disturbance footprint (33.11 hectares (ha)) extends outside the disturbance footprint (35 ha) for the original proposal (please refer to red shaded area in figure below). While the area of disturbance will be reduced, the proposed revised disturbance footprint includes an area not previously included in the original disturbance area (refer to red shaded area in figure below).

In order for the Office of the Environmental Protection Authority to complete its assessment the information in the table below is required.

Factor	OEPA Comments	YPN Comments/Information
Flora and Vegetation	For the area of the proposed revised	
	disturbance footprint that was not	
	previously included in the original	
	disturbance footprint, the following	

	information is required:Please provide flora and vegetation information.	
Terrestrial Fauna	For the area of the proposed revised disturbance footprint that was not previously included in the original disturbance footprint, the following information is required: • Please provide fauna information.	
Hydrological processes	It is noted that the area of the proposed revised disturbance footprint that was not previously included in the original disturbance footprint is within a supratidal area.	
	Please provide information on how the change to proposal will impact the integrity, ecological functions and environmental values of watercourses and surface drainage i.e. the supra-tidal areas as a result of the area of the revised disturbance footprint that is outside the original disturbance footprint.	

Regards,

David Anthony

Senior Environmental Officer
Office of the **Environmental Protection Authority**

Mr Rajan Sinha Deputy General Manager (TAN Project) Burrup Nitrates Pty Ltd Locked Bag 5009 KARRATHA WA 6714

Dear Mr Sinha

STATEMENT 870 - COMPLIANCE ASSESSMENT PLAN

Thank you for your email dated 9 August 2012 submitting the TAN Burrup Project Compliance Assessment Plan (MS870) to the Office of the Environmental Protection Authority (OEPA) as required by Conditions 4-1 and 4-2 of Statement 870.

The OEPA has reviewed the TAN Burrup Project Compliance Assessment Plan (MS870) and determined that it meets the requirements of Conditions 4-1 and 4-2 of Statement 870.

Burrup Nitrates Pty Ltd is advised that the TAN Burrup Project Compliance Assessment Plan (MS870) is acceptable.

Yours sincerely

Kim Taylor

GENERAL MANAGER

3 August 2012

Attachment 4B

Letter to OEPA, dated 6 December 2016, advising of an exceedance of groundwater trigger values.

VARA

BURRUP TAN PROJECT TEAM

To
Mark Rust
Senior Environmental Officer
Office of the Environmental Protection Authority
Locked Bag 10, East Perth
WA - 6892

Date: 21/12/2015

Attn: Mr. Mark Rust

Subject: Report to OEPA for Groundwater Monitoring Result as per Conditions 8-4 of Ministerial Statement No. 870 for Month of November 2015.

Dear Sir.

Reference is made to Contractor's letter 02080-TRS-BNP-L-01212 dated 14 December 2015 Condition 8-4 of Ministerial Statement No. 870, requires YPNPL to sample/monitor all groundwater bores every six months as per Condition 8-3 on a biannual basis. The condition sets a trigger value of 10% above the screening contaminant concentrations as established based on the 2011 data. In accordance with Condition 8-5 of Ministerial Statement No. 870, YPNPL is required to report findings to the CEO of the OEPA within 7 days of the exceedance being identified. It is anticipated that this will be the last pre-operational groundwater monitoring event (GME) prior to the start of plant operations, planned for February 2016.

This letter is intended to inform the OEPA on the outcomes of the latest GME which was undertaken by ERM on behalf of YPNPL at the five existing bores on 23.11.2015, using the consistent sampling methodology applied for the last GMEs (i.e. peristaltic pump low –flow).

In general the results of the recent GME display similar (or even improved) conditions to those documented in the previous GMEs with several parameters having values closer to those identified at the beginning of the construction works in 2012-2013. There were fewer exceedances of the trigger values in November 2015 compared to previous events and in most cases as previously stated, these are considered to be reflective of a natural variability rather than a result of site related potential contamination sources as a result of ongoing construction activities.

BURRUP TAN PROJECT TEAM

More specific, in November 2015 reactive phosphorus, manganese, total nitrogen (oxidised and neutral forms), total Kjendahl nitrogen and total alkalinity were detected at concentrations slightly above trigger values. Due to high salinity of water in the sample from MW4 the detection limit for specific parameters had to be raised (dilution required) by the laboratory. It is noted that three of the seven exceedances relate to various nitrogen based parameters being identified at well MW04.

The details of the exceedances are outlined below:

Reactive Phosphorus as P

 Exceedance at MW3 – 0.021 mg/L compared to the maximum acceptable screening value of 0.011 mg/L Historical results have been below the maximum acceptable screening value with concentrations between <0.002 and 0.021 mg/L, with a previous exceedance of 0.020 mg/L in April 2015.

Manganese (Filtered)

Exceedance at MW4 - 0.975mg/L (value actually identified in the field duplicate QC01 of MW04) compared to the maximum acceptable screening value of 0.242 mg/L, however improved compared to Apr 2015 Historical results have been mostly below the maximum acceptable screening value with concentrations between 0.0029 and 0.277 mg/L, with the highest exceedance of 3.29 mg/L in Apr 2015.

Nitrogen (Total oxidised)

 Exceedance at MW2 – 5.44 mg/L compared to the maximum acceptable screening value of 3.63 mg/L. Historical results have been mostly below the maximum acceptable screening value with concentrations between 0.51 and 3.55 mg/L, with a previous exceedance of 4.95 mg/L in Apr 2014.

Nitrogen (Total)

 Exceedance at MW2 – 6,840 mg/L compared to the maximum acceptable screening value of 5,610 mg/L. Historical results have been consistently below the maximum acceptable screening value with concentrations between 700 and 4,960 mg/L.

Kjeldahl Nitrogen Total

 Exceedance (marginal) at MW5 – 3.05 mg/L compared to the maximum acceptable screening value of 2.97 mg/L. Historical results have been consistently general below the maximum acceptable screening value with concentrations between 0.17 and 2.7 mg/L.

BURRUP TAN PROJECT TEAM

Total alkalinity

 Exceedance (marginal) at MW3 - 582 mg/L compared to the maximum acceptable screening value of 561 mg/L. Historical results have been generally below the maximum acceptable screening value with concentrations between 400 and 560 mg/L and one previous exceedance of 570 mg/L in Apr 2015.

Fluoride

 Exceedance at MW03 – 1.9 mg/L compared to the maximum acceptable screening value of 1.65 mg/L. Historical results have been consistently below the maximum acceptable screening value with concentrations between <0.1 and 1,6 mg/L and a single previous exceedance of 1.7 mg/L in Apr 2014.

In general other analytes were reported at concentrations similar or lower to those recorded in the previous monitoring events. The water quality conditions at one particular well (MW4) that appeared to be different in April 2015 to previously documented levels for some parameters (including salinity, total dissolved solids (TDS), hardness, sulphate, iron, calcium) have returned to historical values, indicating that April 2015 was rather an isolated spike that could be associated with less freshwater contributing to the already hypersaline aquifer at this particular location, in the fall period.

It is noted that at based on the field measurements at well MW05, TDS values have decreased steadily since Oct 2012 (94,705 mg/L) to Nov 2015 (19,949 mg/L), a trend that could be related to additional fresh water inputs. This well is located down gradient from the TAN and therefore could be considered that the source of freshwater that decreases the salinity of the aquifer at this location may be related to construction activities (such as dust suppression water infiltrating into the ground, infiltration from onsite water evaporation ponds, etc.). However, no other parameters that could be of concern (such as heavy metals or nutrients) have increased in concentrations over time and the pH and Eh values at this location have been generally consistent over the monitoring period.

As a general note the dissolved oxygen field measurements at all five wells are as expected, during spring events and deteriorating during fall events, trend confirmed by the November 2015 data.

In conclusion, the GME November 2015 results continue to support the fact that the observed variability in the groundwater chemistry with no clear trends suggests the results depict a combination of natural variability in groundwater chemistry and off site contributions as opposed to increasing concentrations of analytes associated with site activities. Based on the current results, none of the analytes observed exceeding the trigger levels are regarded as directly attributed to current on site activities.

BURRUP TAN PROJECT TEAM

The full GME report is in preparation by ERM and if required by the OEPA this can be provided as further reference to the above stated facts.

Attached to this letter is the summary table showing the November 2015 groundwater monitoring results as well as the historical monitoring data, to enable a review of the variability of the discussed parameters over time since 2011.

Yours sincerely,

Rajan Sinha

Technical Services & Business Development Manager

Mark Rust
Senior Environmental Officer
Office of the Environmental Protection Authority
Locked Bag 10
East Perth WA 6892

Email: mark.rust@epa.wa.gov.au

Dear Mark,

Subject: Report to OEPA for Groundwater Monitoring Results as per Condition 8 of Ministerial Statement No. 870

This letter to inform the OEPA on the outcomes of the latest groundwater monitoring undertaken by Yara Pilbara Nitrates Pty Ltd (YPNPL) at the Technical Ammonium Nitrate Production Facility (TANPF) as required by Conditions 8-4 and 8-5 of Ministerial Statement 870.

Condition 8-4

The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.

Condition 8-5

In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels: 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified; 2. The proponent shall provide evidence which allows determination of the cause of the exceedance; 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO; 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.

Yara Pilbara Nitrates Pty Ltd

YPNPL has reported results to OEPA of previous monitoring regularly (most recently in December 2015), as ongoing monitoring continues to show substantial variation that are considered to be reflective of a natural variability rather than a result of site related potential contamination sources as a result of ongoing construction activities. Since the last report to OEPA in December 2015 progress in commissioning of the TANPF has been significantly slower than anticipated and the plant is yet to be fully commissioned.

Groundwater sampling was undertaken in June 2016, with resampling undertaken in August 2016 to check the representativeness of some results from the June sampling event. Due to limitations in sampling equipment, site MW04 was unable to be sampled. This is being addressed through the acquisition of new sampling equipment that will enable sampling of this bore. MW04 will be sampled at the next monitoring event.

In June 2016 a number of analytes were detected at concentrations slightly above trigger values. When these were retested in August 2016 one (1) analyte at one (1) well, MW02, was found to exceed the trigger value of Total Nitrogen.

The Total Nitrogen value at MW2 of 13,000 μ g/L has exceeded the trigger value of 5,610 μ g/L. As previously reported, this was also exceeded in November 2015 (6,840 μ g/L). YPNPL has initiated an investigation to understand the cause of this elevated Nitrogen value. Results from this investigation will be submitted to the OEPA once it is complete.

Attached to this letter is a summary table showing the 2016 groundwater monitoring results as well as the historical monitoring data, to enable a review of the variability of the parameters over time since 2011.

If you have any queries please do not hesitate to contact Susan Giles, Environmental Superintendent on 9183 4167 or susan.giles@yara.com.

Yours sincerely

Subject: RE: Annual Compliance Assessment Report for Statement 870

Hello Rajan

The OEPA notes your advice that due to construction delays Yara's contractor EPC had not provided Yara with the 2015 Compliance Assessment Report and therefore it was not submitted by the required submission date of 8 October 2015.

The OEPA consider submitting the Compliance Assessment Report for year 2015 by 4 March 2016 to be acceptable on this occasion, but advise Yara that future Compliance Assessment Reports are required to be submitted by 8 October annually.

Kind Regards

Mark

Subject: RE: Annual Compliance Assessment Report for Statement 870

Hi Mark,

Thanks for your mail and reminder on the submission of Compliance Assessment Reports for year 2015. Please note that we have yet to receive the compliance assessment reports for year 2015 from our EPC contractor, as TAN Project has been delayed more than six months due to non-completion of construction activity. We will be able to submit a Compliance Assessment Report for year 2015 by 4th March,16.

Your approval on the above is highly appreciated.

Regards,

Rajan Sinha

Subject: Annual Compliance Assessment Report for Statement 870

Hello Rajan

Condition 4-6 of Statement 870 requires Yara Pilbara Nitrates Pty Ltd (YPNPL) to submit a Compliance Assessment Report annually.

The attached TAN Burrup Project Compliance Assessment Plan (CAP) required by Conditions 4-1 and 4-2 of Statement 870 was submitted to the OEPA by YPNPL on 9 August 2012 and approved by the Office of the Environmental Assessment (OEPA) in a letter dated 23 August 2012.

Section 4 of the CAP states Compliance Assessment Reports will be submitted by 8 October annually. The OEPA have no record of a Compliance Assessment Report for Statement 870 being submitted by 8 October 2015.

If YPNPL did submit a Compliance Assessment Report by 8 October 2015, please provide a copy to the OEPA by close of business on **Tuesday 16 February 2016.**

If YPNPL did not submit a Compliance Assessment Report in 2015 please advise the OEPA by close of business on Tuesday **16 February 2016.**

Kind Regards Mark

Letter from OEPA, dated 18 March 2013, approving revised Air Quality Management Plan and submission on best practice pollution technology.

Mr Rajan Sinha Deputy General Manager Yara Pilbara Nitrates Pty Ltd Locked Bag 5009 KARRATHA WA 6714 Your Ref: 0086269

Our Ref: A574214:OEPA2012/0638-1 Enquiries: Annarie Boer, 6467 5431

Email: annarie.boer@epa.wa.gov.au

Dear Mr Sinha

BURRUP TECHNICAL AMMONIUM NITRATE PRODUCTION FACILITY — AIR QUALITY MANAGEMENT PLAN (MINISTERIAL STATEMENT 870)

Thank you for your communication of 22 February 2013 submitting the revised Burrup Technical Ammonium Nitrate Production Facility Air Quality Management Plan (Reference 0086269) and 'Burrup TAN Plant Emission Comparison with Best Available Techniques Reference Documents' (Document no: 15626-F16-002). The revised plan has been submitted to address previous comments to you provided in Office of Environmental Protection Authority (OEPA) correspondence dated 18 January 2013 and discussed via conference call on 12 February 2013.

These documents have been prepared to address Conditions 5-1 and 5-2 of Ministerial Statement 870. Condition 5-1 states:

The proponent shall adopt and implement best practice pollution control technology as determined by the Chief Executive Officer of the Department of Environment and Conservation (DEC) on advice of the CEO to minimise all relevant emissions from the TANPF ammonium nitrate prilling plant.

Condition 5-2 states:

Prior to construction, the proponent shall prepare and implement an ambient air monitoring programme to the satisfaction of the CEO on the advice of the Chief Executive Officer of the DEC.

The revised Plan has been reviewed by the OEPA and is considered to address the relevant conditions above.

If there are any changes to the Plan that would substantially affect the management actions or targets, the amended plan would require submittal to the OEPA.

Should you have any queries with regard to content of this letter, please contact Annarie Boer on 6467 5431.

Yours sincerely

Kim Taylor

Dear Sir,

Subject: Proposed Change to Air Quality Management Plan approved under Condition 5 of Ministerial Statement No. 870

This letter follows from the 2016 Compliance Assessment Report (CAR) that Yara Pilbara Nitrates Pty Ltd (YPN) submitted for the Technical Ammonium Nitrate (TAN) Plant on 6 October 2016. In the CAR, YPN reported that the construction phase air quality monitoring had not been effectively implemented during the reporting period (8 July 2015 to 7 July 2016) and that the air emissions risk profile of the Plant had significantly changed. Specifically, the air emissions risk profile for the past 12-18 months had been more representative of the operations phase air emissions rather than construction phase air emissions.

YPN requests a variation to the implementation of the OEPA approved Air Quality Management Plan (AQMP) to recognise this change in risk profile. It is proposed that air quality monitoring being undertaken for the TAN plant during the current reporting period (8 July 2016 – 7 July 2017) will be that described in the AQMP as 'Operational Monitoring', including both stack emissions monitoring and off-site ambient air quality monitoring.

This change will bring the air quality monitoring in line with the monitoring described in the Commissioning Environmental Management Plan that has been approved by the Department of Environment Regulation as a requirement of the Works Approval W4701/2010/1.

YPN acknowledges that this request is an interim measure, as YPN intends to update and revise the AQMP once in operations and the requirements of Works Approval W4701/2010/1 have been met and YPN has successfully acquired an Operating Licence (issued in accordance with the *Environmental Protection Act 1986*).

If you have any queries please do not hesitate to contact Susan Giles, Environmental Superintendent on 9183 4167 or susan.giles@yara.com.

Yours Sincerely,

Jason BARTLETT

Acting HESQ Manager

Yara Pilbara Nitrates

Letter from OEPA, dated 22 December 2016, acknowledging the variation to the implementation of the AQMP

Mr Brian Howarth Health, Environment, Safety & Quality Manager Yara Pilbara Nitrates Pty Ltd Locked Bag 5009 KARRATHA WA 6714

Our Ref: CA01-2013-0018

Enquiries: Matt Spence, 6145 0819 Email:

matt.spence@epa.wa.gov.au

Dear Mr Howarth

MINISTERIAL STATEMENT 870 - AIR QUALITY MANAGEMENT PLAN

Thank you for your letter to the Office of the Environmental Protection Authority (OEPA) dated 8 December 2016 regarding the implementation of the OEPA approved Air Quality Management Plan (AQMP) at the Technical Ammonium Nitrate Plant.

The OEPA understands that following the completion of construction activities there has been a change in risk profile for impacts to air quality. Therefore, future monitoring is proposed to be carried out as described within the "Operational Monitoring' section of the approved AQMP, which will include both stack emissions monitoring and offsite ambient air quality monitoring.

This approach is acceptable to the OEPA, and the Proponent should continue to implement the approved AQMP. Any changes to the implementation of the AQMP must to be submitted to the OEPA for approval.

If you have any questions please contact Matt Spence 6145 0819.

Yours sincerely

MANAGER, COMPLIANCE BRANCH

22 December 2016

1. Introduction

Yara Pilbara Nitrates Pty Ltd (YPN) has recently constructed a Technical Ammonium Nitrate (TAN) Plant on the Burrup Peninsula and is soon to commence production. Ministerial Statement 870 (MS870), which gave approval for the TAN Plant project to proceed includes the following Conditions which need to be complied with:

Condition 6.1.5: No new species of weeds (including both declared weeds and environmental weeds) shall be introduced into the area as a result of the implementation of the proposal; and **Condition 6.1.6**: The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring undertaken prior to the commencement of operations, or exceed that existent on comparable, nearby land which has not been disturbed during implementation of the proposal.

The TAN Plant has been constructed and is being commissioned by Engineering Procurement and Construction (EPC) contractor Technicas Reunidas(TR). TR has implemented some weed control to comply with their Construction Environmental Management Plan during the construction period (Tecnicas Reunida 2012). However in the 2016 MS870 Compliance Assessment Report, YPN was not able to demonstrate that there had been no new weed species introduced to the plant site during construction. YPN committed to undertaking a weed survey by a qualified botanist to ascertain the presence and relative abundance of weed species at the TAN Plant site.

YPN received correspondence from the Office of Environmental Protection Authority (OPEA) responding to the submitted Compliance Assessment Report and asking YPN for a response on the status of weeds on the site by January 31st 2017. In order to meet this deadline, YPN requested Vicki Long & Associates (VLA) conduct a weed survey of their Burrup TAN plant site and lease area. This was conducted on December 21st 2016, some 6 months following rainfall. The report recommended a second survey be conducted at an appropriate time following adequate rainfall in order to gain a better understanding of weeds on the site. VLA was requested to conduct this work in April 2017 following a total of 369 mm rainfall received in January and February 2017. This report details the results of the April 2017 survey.

2. Scope

The scope of work was to conduct a follow up weed survey of Lot 3017, Village Road, Burrup (the TAN Plant site and lease); to identify and locate (with hand held GPS) any declared and/or environmental weeds present. Weed presence and abundance was to be compared with the project baseline survey data.

3. The Site

The Yara TAN Plant site is located on the eastern side of the Burrup Peninsula (Murujuga) on the Pilbara coastline, some 20 km north of Karratha within the Burrup Strategic Industrial Area. It sits on the northern side of the King Bay tidal inlet and west of Hearson Cove. The Yara TAN site 49 hectares (ha), of which the TAN Plant comprises some 33.11 ha.

The site was, pre-construction, biologically complex, extending from the lower toe of the rocky hill slopes to the north across coastal flats and small sandy "islands" tapering to the tidal inlet to the south. The Level 1 botanical survey conducted for the Public Environmental Review (PER) (Outback Ecology Services 2010) discusses five broad vegetation types over the TAN Plant site, although it does appear from the vegetation map in that report (Figure 2 of Annex 1) (ERM 2010) that 15 vegetation communities actually occurred on the site pre-construction. The remnant vegetation within the lease area that are outside of and to the south of the plant site identified in the baseline survey (Outback Ecology Services 2010) are based on the Trudgen report (2002) mapping and are described as:

AbTeWa (coastal flats): High open to open heath of *Acacia bivenosa, A. coriacea subsp coriacea* over low open shrubland over *Triodia epactia* hummock grassland and mixed closed grasses over herbs, and:

Sm (saline inlet and supratidal flats): Tecticornia spp. Scattered low shrubs to open heath.

VLA (2017) recorded the vegetation currently existing within the lease as:

AbTttCc (coastal flats): *Acacia bivenosa* open (2-10%) to scattered (<2%) tall shrubland over open *Trianthema turgidifolia* low shrubland (2-10%) over *Cenchrus ciliaris* tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) *Triodia epactia*.

CcTsp (fringing saline inlet and coastal flats): *Cenchrus ciliaris* closed tussock grassland (70-100%) with scattered (<2%) low shrubs of *Tecticornia* species and *Trianthema turgidifolia* fringing tidal inlet.

Tspp (saline inlet and supratidal flats): *Tecticornia* species low open shrubland (2-10%) to scattered low shrubs (<2) on tidal inlet

4. Methods

Aerial photos were used to identity survey areas both within and beyond the plant site. All areas were traversed by foot. At each weed location the following attributes were recorded.

Table 1: Attributes recorded at weed locations in 2017 survey

Attribute	Description		
Species name	Current taxonomic species name of all weed species		
Collection Id	Unique identifying code was assigned if a specimen was collected		
Location	Coordinates of the weed point location (GDA94)		
Recorder and date	Personnel involved in sampling at location and survey date		
Cover (within a stated	An estimate of foliar cover as a percent value (1; 5; 10; 20; 30; 40; 50; 60; 70; 80;		
area)	90 and 100) within a determined area, usually defined by infrastructure boundaries, pre-construction boundaries, natural features.		
Life Stage	Non-flowering; Flowering; Set Seed; Seeding		

5. Survey Personnel and Timing

The field survey was conducted by Vicki Long, a botanist/ecologist with over 30 years of experience in the Pilbara. Vicki has been involved in numerous weed surveys on the Burrup Peninsula and coastal Pilbara and is well qualified to detect new incursions and assess current infestations. Vicki was accompanied by Nicole Ivory, Graduate Environmental Officer Yara.

The survey of the Yara TAN lease was conducted on the 5th of April 2017. Above average rainfall had been received in January and February 2017 when 130.4 mm and 238.6 mm (a total of 369.0 mm) of rainfall were received respectively. This meant that grass species were in late flower/early seed stage and that later developing annual and perennial herbaceous species were in early flower so all weed species could be easily identified.

6. Taxonomy and Nomenclature

All species recorded were able to be identified in the field by the surveying botanist.

7. Results

7.1 Vegetation Condition - General

A discussion is given in the previous weed survey report (VLA 2017) with regard to deteriorating vegetation condition due to an increase in buffel grass between the Trudgen mapping in 2000 (Trudgen 2002) and the baseline survey report for the project (Outback Ecology Services 2010). In the 2017 report, VLA recorded a similar abundance of buffel grass present to that reported by Outback Ecology Services (2010). Three vegetation associations were described by VLA (2017) based on Muir (1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970) (Appendix A Table A.1) and vegetation condition is based on Trudgen (1988) (Appendix A Table A.2).

Since December 2016 there has been a significant die off of *Acacia bivenosa* on the south and eastern sides of the plant site. This is most severe on the southern side where the population mortality was recorded as 98%. Interestingly, no new seedlings have emerged in this population, which is the usual response to age related deaths of shorter lived acacia populations, to replace dead shrubs.

It is noted that currently local groundwater levels are at >10 year highs (as evidenced by bores on YPF site) and it is postulated that the saline groundwater associated with the King Bay Tidal flats have risen above the root level of the Acacia population, causing widespread mortality due to salinity and associated drought. Records over the past 45 years (Karratha Aero Station No 4083) indicate that, despite the somewhat erratic nature of rainfall events in the Pilbara, annual rainfall between 1972 and 1996 was relatively stable. During this period annual totals were generally between 180 – 280 mm, with the occasional exceptions (505 mm in 1973 and only 53 mm in 1983). It appears that between 1997 and 2017, rainfall has become more erratic and much higher total rainfall is being recorded more frequently (eg. 552 mm in 1999, 855 mm in 2006, 489 in 2009, 765 mm in 2011, 594 mm in 2013 and between January and March 2017, 415 mm was received). It is likely that during each of these years of major rainfall, saline groundwater beneath the near coastal areas would be mobilised by the substantial sub-surface flows which occur during and after heavy rainfall events. Additionally surface run-off from the surrounding ranges would dissolve salt in the

soil column deposited on these near coastal dunes due to their proximity to the sea, further causing the salinity of shallow groundwater to rise. Although *Acacia bivenosa* is known to be somewhat saline tolerant, it is probable that repeated saline impacts would eventually stress plants significantly. The regularity of the high rainfall events over the past 10 years would not allow plants to recover fully. This is hypothesis only as the populations have not been monitored over that period.

Vegetation as recorded in the December 2016 survey (VLA 2017) and its current condition in the area are described in Table 2.

Table 2: Vegetation descriptions for remnant vegetation east and south of Yara TAN plant site (within lease)

Code	Vegetation Description ¹	Condition ²
AbTtCc (2016) TtCc (2017)	Acacia bivenosa open (2-10%) to scattered (<2%) tall shrubland over open Trianthema turgidifolia low shrubland (2-10%) over Cenchrus ciliaris tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) Triodia epactia on sandy flats. Open Trianthema turgidifolia low shrubland (2-10%) over Cenchrus ciliaris tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) Triodia epactia on sandy flats.	Very Poor
СсТѕр	Cenchrus ciliaris closed tussock grassland (70-100%) with scattered (<2%) low shrubs of Tecticornia species and Trianthema turgidifolia fringing tidal inlet.	Completely Degraded
Tspp	Tecticornia species low open shrubland (2-10%) to scattered low shrubs (<2) on tidal inlet.	Very Good

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

7.2 Weed Species Recorded

No Declared Pests were found on the site (Appendix B Table B.1 and B.2)

Three weeds were recorded in the 2017 Tan lease survey, one being new to the Yara TAN Plant site.

Two plants of *Indigofera sessiliflora* were recorded on a rock batter along the south-eastern end of the plant site at GPS co-ordinate: 0477966E 7719316N. This weed is not listed by Hussey *et al* (1997) but is listed on FloraBase (DBCA 2017). It has previously been recorded at Port Hedland and Cape Preston. The earliest record of the plant is in 1991 (Keighery 2010). It has been observed growing on disturbed areas around Karratha, particularly near the coast (V Long *per obs*) and the author believes it is more widespread than indicated in FloraBase. It has been previously recorded by the author and others at Port Hedland.

The other weeds recorded were *Cenchrus ciliaris* (buffel grass) and *Aerva javanica* (kapok) and both species have been recorded in previous surveys. The Department of Biodiversity, Conservation and Attractions (DBCA) classify weeds in each region, termed "environmental weeds". These are weeds that may impact on natural, rather than agricultural or horticultural, values and are ranked based on

²Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

invasiveness, ecological impact, potential and current distribution and the feasibility for control. Weed rankings are shown in Appendix B Table B.3. The three weed species found on the Yara TAN site are classified as environmental weeds. The priority for management is defined by these risk rating categories (DPAW 2013).

With regard to the weed rankings, it should be remembered that they are formulated for the entire Pilbara region, much of which is under pastoral lease where buffel grass in particular is a highly valued fodder species. Both buffel grass and kapok are now widespread in the Pilbara and control is no longer a feasible option for the wider area. The Burrup Peninsula however, like some offshore islands, is still relatively weed-free apart from in the Industrial Zone. The vegetation types found on the Burrup Peninsula (Murujuga National Park) are not replicated anywhere else on the Pilbara mainland (Trudgen 2002). Put into context, the vegetation of the Burrup is unique and has high conservation value. Given this, the fact that Murujuga National Park is a tourist asset and the globally acknowledged heritage value of the rock art, the "High" ranking for both buffel grass and kapok on the Burrup should be taken seriously.

Table 3: Inventory of weed species recorded within the Yara TAN lease, weed policy classifications and recommended management options. (Australian Weeds Committee 2012; Department of Parks and Wildlife 2013)

Species Name (common name)	Classification ¹
Aerva javanica (kapok)	Environmental weed (High; D,E)
Cenchrus ciliaris (buffel grass)	Environmental weed (High, D)
Indigofera sessiliflora	Environmental weed (TBA)

¹Management actions that may be considered for each ranking are included in Appendix B.

Buffel grass and kapok were both recorded present in the Level 1 baseline survey conducted for the PER in March 2009 (Outback Ecology 2009). *Indigofera sessiliflora* was not recorded in 2009. *Vachellia farnesiana* recorded during that survey was not detected in this 2016 survey.

7.3 Cover and Life Stage

Plant Site

The plant site is comprised of two distinct areas: the operating plant area and the surrounding infrastructure, office and boundary areas.

The operating plant area is heavily gravelled which continues to result in very low weed presence (0-<1%).

The area peripheral to the operating plant area includes stony batters, office sites on surfaces of dirt or cracker dust, mostly dis-used laydown areas and an area of stockpiled soil. These areas had varying weed presence and, as would be expected following abundant summer rainfall, foliar cover and abundances were much higher than recorded in the December survey. Kapok and buffel were equally recorded this visit and densities ranged from 10% to 85% for both species, compared to December when kapok was the most recorded species with cover ranges from <1% to 20% and up to 60% at some weed record points and buffel, which was much less abundant (as would be expected at that time of year) ranged from <2% to 10%.

Buffel was generally recorded as flowering and seeding whilst the majority of kapok was in early flower stage.

Locations, abundances for each species, life stage of weeds recorded are given in Table 1 Appendix C. Because of the varied percent cover of both buffel grass and kapok at each location, a density range was developed which considers the total weed cover at each location where the record was made. Cover ranges are:

Description	% Cover in area assessed			
Very Dense	80-100			
Dense	60-80			
Moderate/Dense	30-60			
Moderate	10-30			
Sparse	2-10			
Scattered	0-2			

Total % cover of buffel grass and kapok are mapped within these ranges in Appendix D Figure 1. The map references should be cross referenced with Table 1 in Appendix C which indicates the individual abundances of kapok and buffel separately at each weed location point.

Lease area south and south east of Plant Site

The area outside the plant site fence (but within Yara TAN's lease) to the east and south east was heavily infested with buffel grass. Both areas had an estimated buffel grass cover of 70% to 90% of the total area and kapok varied from 10% to 60%. Locations, abundances and lifestage are included in Table 1 Appendix C and range abundances are mapped in Appendix D Figure 1.

7.4 Comparison with Previous Weed Mapping

The Scope of Works requirement to compare the type and abundance of weeds to the baseline survey (2009) can only be done superficially for reasons described in VLA report (January 2017).

Weed mapping was conducted in July and October 2013 and a map is included in the Compliance Report for Weed Management Attachment 04 *Weed Mapping Report* (Tecnicas Reunidas 2014). The map does show the location of buffel and kapok and "fumigation" efforts in 2013 but does not indicate abundance.

From the previous literature available, it appears that the locations of buffel and kapok within the plant site area have remained the same but there has been further spread into the western side of the plant site and along the access road into the site since 2013. A comparison of species abundance cannot be commented on. The area outside the plant site, on the eastern and southern sides of the lease appears to have remained constant, given that no Vegetation Condition Scale was referred to in that report, since the baseline survey in 2009.

The MS870 Condition 6.1.6 states "The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring .." As Yara have not undertaken any specific revegetation to date, the Scope of Work requirement to compare current abundances with baseline survey goes beyond compliance and shows environmental integrity.

A weed map is presented in Appendix D Figure 1.

A description of weeds found during the survey on both the Yara TAN plant and Yara Ammonia plant, and potential weed species to be alert for are presented in Appendix E.

1. Discussion and Recommendations

One new weed was recorded in the Yara TAN lease area this survey. *Indigofera sessiliflora* has not been recorded on the lease or the wider Burrup previously.

• It is recommended that the two plants recorded be removed immediately and that the surrounding area be thoroughly searched for any others. These can be hand pulled.

The weed rankings for both kapok and buffel grass have recently been elevated to "High" by DBCA, however the management options (DPaW 2013), which have not been correspondingly reviewed, remain for both weeds as "D – Protect Priority Sites" and "E – Targeted control to reduce infestations at priority sites". Given the high conservation value of the vegetation of the Burrup Peninsula, these management options to keep weeds contained and or controlled within the Yara TAN plant site is sound environmental practice. In saying this the eastern and southern area beyond the plant site are now in very poor to degraded condition and it is not likely that buffel grass could be controlled in this area, nor would it be cost and time effective to do so. Based on the results of this survey the following recommendations are made.

- Yara TAN consider a weed program for each species based on risk, time and resources to ensure effectiveness of weed control.
- Within the plant site, both buffel grass but particularly kapok should be controlled. Lower
 priority can be given to gravelled areas, and high priority to the outer boundaries of the
 plant site particularly along the northern and western boundaries.
- Control methods and timing should be undertaken according to a Weed Management Plan which will indicate best times for treatment.
- The eastern and southern area outside the plant site area should be monitored at appropriate times and following sufficient rainfall to check for any new weed incursions only. Control is not considered viable in this area.
- A weed audit to check for new weed incursions and to assess the effectiveness of weed treatment should be done annually as dictated by a Weed Management Plan.

APPENDIX A Vegetation Description Scale and Vegetation Condition Scale

Vegetation Structural Classes¹

Table A.1 Vegetation descriptions based on Muir (1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970)

Stratum	Canopy Cover (%)						
	70-100% 30-70%		10-30%	2-10%	<2%		
Trees over 30 m	Tall closed forest	Tall open forest	Tall woodland	Tall open woodland	Scattered tall trees		
Trees 10-20 m	Closed forest	Open forest	Woodland	Open woodland	Scattered trees		
Trees under 10 m	Low closed forest	Low open forest	Low woodland	Low open woodland	Scattered low trees		
Shrubs over 2 m	Tall closed scrub	Tall open scrub	Tall shrubland	Tall open shrubland	Scattered tall shrubs		
Shrubs 1-2 m	Closed heath	Open heath	Shrubland	Open shrubland	Scattered shrubs		
Shrubs under 1 m	Low closed heath	Low open heath	Low shrubland	Low open shrubland	Scattered low shrubs		
Hummock grasses	Closed hummock grassland	Hummock grassland	Open hummock grassland	Very open hummock grassland	Scattered hummock grasses		
Grasses, Sedges Herbs	Closed tussock grassland / bunch grassland/ sedgeland / herbland	Tussock grassland / bunch grassland /sedgeland / herbland	Open tussock grassland / bunch grassland /sedgeland / herbland	Very open tussock grassland / bunch grassland /sedgeland / herbland	Scattered tussock grasses / bunch grasses/ sedges/ herbs		

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

Vegetation Condition Scale¹

Table A.2 Vegetation Condition Scale based on Trudgen M.E. (1988)

E = Excellent

Pristine or nearly so; no obvious signs of damage caused by the activities of man.

VG = Very Good

Some relatively slight signs of damage caused by the activities of man. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks.

G = Good

More obvious signs of damage cuased by the activities of man, including some obvious impact on the vegetation structure such as that caused by the low levels of grazing or by selective logging. Weeds as above plus some more aggressive weeds.

P = Poor

Still retains some basic vegetation structure or ability to regenerate to it after very obvious impacts of activities of man, such as grazing, partial clearing (chaining) or frequent fires. Weeds as above plus some more aggressive weeds.

VP = Very Poor

Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species including very aggressive species.

D = Completely Degraded Areas that are completely or almost completely without any native species in the structure of their vegetation: ie areas that are cleared or "parkland cleared" with their flora comprising weed or crop species with isolated native trees or shrubs.

¹Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

APPENDIX B Weed Classifications

Weed Classifications

Weeds of National Significance (WONs)

Thirty-two WoNS have been agreed by the Australian State and Territory governments, based on the weed species' invasiveness, potential for spread and environmental, social and economic impacts (Australian Government, 2011). In Western Australia, many WoNS are also declared pests under the BAM Act.

Declared Pests

The Department of Agriculture and Food Western Australia (DAFWA) regulates weeds under the Biosecurity and Agriculture Management Act 2007 (BAM Act), which supersedes the Agriculture and Related Resources Protection Act 1976. Weeds are grouped into four main classifications (Table 1).

Table B.1: Categorisation of plants under the BAM Act

Category	Description			
Permitted organisms under section 11	Organisms that are allowed entry into Western Australia			
Prohibited organisms under section 12	Organisms that are prohibited from entry into Western Australia			
Unlisted organisms under section 14	If an organism cannot be categorised as either permitted or prohibited the organism will be unlisted			
Declared pest under section 22	Pests that may be in the State but are under official containment, control or eradication			

Plants that are prevented entry into the State or have control or keeping requirements within the State are declared pests. Declared pests can be assigned to a C1, C2 or C3 category under the BAM Act Regulations 2013. Prohibited organisms can be assigned to a C1 or C2 control category (Table 2).

Table B.2: Categories of declared pests under the BAM Act regulations.

Category	Description		
C1 Exclusion	Plants which should be excluded from part or all of Western Australia.		
C2 Eradication	Plants which should be eradicated from part or all of Western Australia.		
C3 Management	Plants that should have some form of management applied that will alleviate the harmful impact of the plant, reduce the numbers or distribution of the plant or prevent or contain the spread of the plant.		

Landholders, managers and occupiers of land are responsible for the management declared pests on their land. The Western Australian Organisms List contains information on the area(s) in which a pest is declared and the control and keeping categories to which it has be assigned in Western Australia.

Environmental Weeds

The Weed Prioritisation Process for the Department of Biodiversity, Conservation and Attractions (DBXA) prioritise weeds in each DBCA region. The process ranks weeds based on their invasiveness, ecological impact, potential and current distribution and the feasibility for control. Within each region, each weed species has been ranked by risk. Table B.3 (DBCA 2016).

Table B.3: Weed species rankings (DBCA) 2016.

Weed Species Ranking	Objective			
VH – Very High	Eradication			
H - High	Eradication or control to reduce			
M – Medium	Control to reduce or containment			
L – Low	Containment at key sites only			
N - Negligible	No action to be undertaken but may include monitoring only			

The weed ranking includes examples of management actions that may be appropriate. Management actions that can be applied are presented in (Table B.4) (Parks and Wildlife 2013).

Table B.4: Examples of management actions that may be considered for each ranking (Parks and Wildlife, 2013).

Management Code	Explanation
А	No action (the weed species ranking is so low as to not warrant any investment in regional strategic management actions)
В	Monitor only (aims to detect any significant changes in the species' weed risk or management ability)
С	Improve general weed management (aims to minimise weed impact and maintain the overall biodiversity, social, cultural and economic values on the region through improved general weed management
D	Protect priority sites (aims to prevent spread of weed species to key sites/assets of high biodiversity, social, cultural or economic value)
E	Targeted control to reduce infestations at priority sites (may include biocontrol) (aims to significantly reduce the impact of a weed species on key sites/assets of high biodiversity, social, cultural or economic value through targeted management)
F	Contain regional spread (aims to prevent the ongoing spread of the weed species in the region)
G	Reduce regional infestations (may include biocontrol) (aims to significantly reduce the extent of the weed species in the region)
Н	Regional eradication (aims to remove the weeds species from the region)
1	State-wide eradication (aims to remove the weed species from the State)

^{1.} Total cover = total cover cover of weeds on the area and the category is described as: 100-80% Very Dense (VD), 60-80 % Dense (D) 30-60% Moderately Dense (MD), 10-30% Moderate (M), 2-10% Sparse (S) and 0-2% Scattered (Sc)

APPENDIX D
Weed Map

APPENDIX E Weed Descriptions – Weeds Occurring on Yara Site and Potential Weeds

WEEDS OCCURRING ON YARA SITE AND POTENTIAL WEEDS.

Species Description

OCCURS ON BOTH TAN AND AMMONIA SITES

Common Name: Kapok Scientific Name: Aerva javanica Family: Amaranthaceae

Description: An upright herbaceous plant or small shrub 30 - 150 cm tall. Stems and leaves are densely covered in whitish woolly hairs. It has simple leaves, alternate along stems; shape varies from long and narrow to almost roundish. The whitish flowers are borne in elongated finger-like clusters at the tips of the branches. Separate male and female flowers are borne on separate plants, males are generally more slender. The flowers are stalkless, and have 3 very woolly white bracts which almost hide the 5 small petals. The tiny capsule like fruit contain a single back or brown shiny seed.

Kapok is in the same family as the mulla mullas which also like disturbed areas.

Origin: Native to northern Africa to south west Asia.

OCCURS ON BOTH TAN AND AMMONIA SITES

Common Name: Buffel Grass **Scientific Name:** *Cenchrus ciliaris*

Family: Poaceae

Description: A tall vigorous perennial tussock grass, can be small and wispy or dense tall tussocky plants. Appears very quickly after summer rains. Stems are branching 30-130 cm long, tough, smooth. Leaf blades are long and slender tapering to a point, green or blue-green, with a rough edge. Where they meet the stmem is a rim of hairs. They grow more from the stems than the base. Flower usually purple tinged. Seedhead is erect, straw, grey or purple coloured.

Origin: Native to tropical Africa

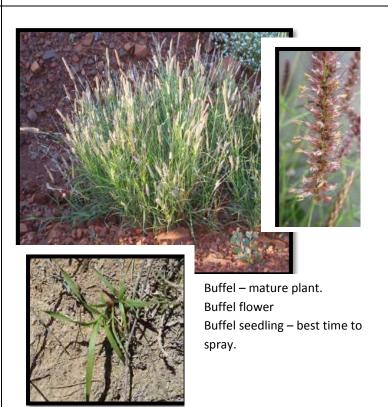

Photo

Kapok seedling – ideally spray at this stage.

Kapok in flower.

Species Description

Photo

OCCURS ON TAN SITE

Common Name: None

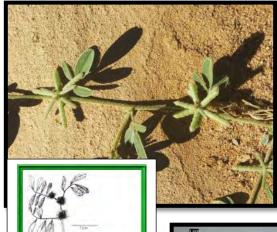

Scientific Name: Indigofera sessiliflora

Family: Fabaceae

Description: A small semi-prostrate (grows along the ground) annual or biennial herb. Leaflets 3-5 are small, grey-green covered in very dense long stiff hairs. The flowers are pale red (flowers September) and are partially enclosed in a very hairy calyx with long pointed tips. The legumes are cylinder shaped and covered in long hairs. They attach directly to the stem in clusters of 5-7.

Origin: Southern Asia

The plant is found on sand, dunes and disturbed situations along the coastline.

Indigofera sessiliflora plant with legumes; line drawing and mature legume with calyx.

OCCURS ON YARA AMMONIA SITE

Common Name: Bull Rush Scientific Name: Typha sp

Family: Typhaceae

Description: Tall robust plant with broad leaves to 2 m. Leaves grow in bunches from below water level. Flowering stems are stiff and grow erect from the centre of the leaf cluster. They bear oblong brown compact masses of tiny furry flowers hundreds of

which disperse when ripe.

The plant is very difficult to control due to prolific seed production and should be sprayed with glyphosate when actively growing before seed is set. Keighery claims both species of typha in WA are native but DPaW (Florabase) suggest control should be undertaken.

Origin: Unknown

Typha growing on the edge of King Bay mangal system.

Flowers produce prolific seed.

Species Description

RECORDED PREVIOUSLY BUT NOT CURRENTLY ON SITE*

Common Name: Mimosa Bush Scientific Name: Vachellia farnesiana

Family: Fabaceae

Description: Mimosa bush is a spreading shrub grows to 4 m tall The leaves are bipinnate (each leaf "branch" that comes off of a stem is divided into smaller "branches" which is each comprised of many leaflets) and have paired spines, up to 2.5 cm long, at their bases. Small, round, yellow flowers are produced in clusters, followed by cigar-shaped seedpods that start out green and turn black in colour.

It is distinguished from its look-a-like, Declared Pest Mesquite by the "warts" on its branches.

Origin: South America

*this was probably a mis-identification. It would probably have been the similar looking *Dichrostachys spicata* (native)

Photo

Mimosa Bush: habit

Mimosa Bush flower, seed pod and leaf.

POTENTIAL TO OCCUR ON SITE

Common Name: Wild gooseberry Scientific Name: Physalis angulala

Family: Solanaceae

Description: A much branched, almost hairless herbaceous shrub. It has a characteristic angled, hollow stem. Its light green leaves are more or less oval shaped with a slightly toothed edge. It has small pale yellow 5-sided flowers and a 3 cm long lantern shaped calyx enclosing the fruit.

Origin: Tropical America now spread throughout tropical and temperate regions of the world.

Flower and fruit of Wild gooseberry.

Species Description

POTENTIAL TO OCCUR ON SITE

Common Name: Tridax

Scientific Name: *Tridax procumbens*

Family: Asteraceae

Description: Low perennial herb with stems that spread horizontally before rising erect. Stems clothed in pale hairs. Has roughly oval shaped lobed leaves with stiff hairs. Small (to 10 mm) solitary flowerheads have cream ray florets (petal like) with a yellow centre (disc florets). The seeds are small 5-6 mm and featherlike, thus spread quickly in local winds.

Contact with this plant can sometimes cause skin irritation.

Origin: Native to central America, now widespread throughout tropics and subtropics.

Photo

Tridax habit, leaf and flower.

POENTIAL TO OCCUR ON SITE

Common Name: Stinking Passion

Flower

Scientific Name: Passiflora foetida

Family: Passifloraceae

Description: A climbing, scrambling rapidly spreading vine with sticky hairs and tendrils from the base of leaves. Leaves have three rounded lobes and vary from 2 to 5 cm long. Flowers are white and purple. Fruits are yellow to orange and contain numerous brownish seeds within a tasty flesh.

This species is rapidly spreading on the Burrup Peninsula and in the Karratha area generally.

Origin: native to southern USA, Mexico, Central America. Now a serious weed threat in the Kimberley.

Passiflora flower, vine and ripe fruit.

1. Introduction

Yara Pilbara Nitrates Pty Ltd (YPN) has recently constructed a Technical Ammonium Nitrate (TAN) Plant on the Burrup Peninsula and is soon to commence production. Ministerial Statement 870 (MS870), which gave approval for the TAN Plant project to proceed includes the following Conditions which need to be complied with:

Condition 6.1.5: No new species of weeds (including both declared weeds and environmental weeds) shall be introduced into the area as a result of the implementation of the proposal; and **Condition 6.1.6**: The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring undertaken prior to the commencement of operations, or exceed that existent on comparable, nearby land which has not been disturbed during implementation of the proposal.

The TAN Plant has been constructed and is being commissioned by Engineering Procurement and Construction (EPC) contractor Technicas Reunidas(TR). TR has implemented some weed control to comply with their Construction Environmental Management Plan during the construction period (Tecnicas Reunida 2012). However in the 2016 MS870 Compliance Assessment Report, YPN was not able to demonstrate that there had been no new weed species introduced to the plant site during construction. YPN committed to undertaking a weed survey by a qualified botanist to ascertain the presence and relative abundance of weed species at the TAN Plant site.

YPN received correspondence from the Office of Environmental Protection Authority (OPEA) responding to the submitted Compliance Assessment Report and asking YPN for a response on the status of weeds on the site by January 31st 2017. In order to meet this deadline, YPN requested Vicki Long & Associates (VLA) conduct a weed survey of their Burrup TAN plant site and lease area. This was conducted on December 21st 2016, some 6 months following rainfall. The report recommended a second survey be conducted at an appropriate time following adequate rainfall in order to gain a better understanding of weeds on the site. VLA was requested to conduct this work in April 2017 following a total of 369 mm rainfall received in January and February 2017. This report details the results of the April 2017 survey.

2. Scope

The scope of work was to conduct a follow up weed survey of Lot 3017, Village Road, Burrup (the TAN Plant site and lease); to identify and locate (with hand held GPS) any declared and/or environmental weeds present. Weed presence and abundance was to be compared with the project baseline survey data.

3. The Site

The Yara TAN Plant site is located on the eastern side of the Burrup Peninsula (Murujuga) on the Pilbara coastline, some 20 km north of Karratha within the Burrup Strategic Industrial Area. It sits on the northern side of the King Bay tidal inlet and west of Hearson Cove. The Yara TAN site 49 hectares (ha), of which the TAN Plant comprises some 33.11 ha.

The site was, pre-construction, biologically complex, extending from the lower toe of the rocky hill slopes to the north across coastal flats and small sandy "islands" tapering to the tidal inlet to the south. The Level 1 botanical survey conducted for the Public Environmental Review (PER) (Outback Ecology Services 2010) discusses five broad vegetation types over the TAN Plant site, although it does appear from the vegetation map in that report (Figure 2 of Annex 1) (ERM 2010) that 15 vegetation communities actually occurred on the site pre-construction. The remnant vegetation within the lease area that are outside of and to the south of the plant site identified in the baseline survey (Outback Ecology Services 2010) are based on the Trudgen report (2002) mapping and are described as:

AbTeWa (coastal flats): High open to open heath of *Acacia bivenosa, A. coriacea subsp coriacea* over low open shrubland over *Triodia epactia* hummock grassland and mixed closed grasses over herbs, and:

Sm (saline inlet and supratidal flats): Tecticornia spp. Scattered low shrubs to open heath.

VLA (2017) recorded the vegetation currently existing within the lease as:

AbTttCc (coastal flats): *Acacia bivenosa* open (2-10%) to scattered (<2%) tall shrubland over open *Trianthema turgidifolia* low shrubland (2-10%) over *Cenchrus ciliaris* tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) *Triodia epactia*.

CcTsp (fringing saline inlet and coastal flats): *Cenchrus ciliaris* closed tussock grassland (70-100%) with scattered (<2%) low shrubs of *Tecticornia* species and *Trianthema turgidifolia* fringing tidal inlet.

Tspp (saline inlet and supratidal flats): *Tecticornia* species low open shrubland (2-10%) to scattered low shrubs (<2) on tidal inlet

4. Methods

Aerial photos were used to identity survey areas both within and beyond the plant site. All areas were traversed by foot. At each weed location the following attributes were recorded.

Table 1: Attributes recorded at weed locations in 2017 survey

Attribute	Description			
Species name	Current taxonomic species name of all weed species			
Collection Id	Unique identifying code was assigned if a specimen was collected			
Location	Coordinates of the weed point location (GDA94)			
Recorder and date	Personnel involved in sampling at location and survey date			
Cover (within a stated	An estimate of foliar cover as a percent value (1; 5; 10; 20; 30; 40; 50; 60; 70; 80;			
area)	90 and 100) within a determined area, usually defined by infrastructure boundaries, pre-construction boundaries, natural features.			
Life Stage	Non-flowering; Flowering; Set Seed; Seeding			

5. Survey Personnel and Timing

The field survey was conducted by Vicki Long, a botanist/ecologist with over 30 years of experience in the Pilbara. Vicki has been involved in numerous weed surveys on the Burrup Peninsula and coastal Pilbara and is well qualified to detect new incursions and assess current infestations. Vicki was accompanied by Nicole Ivory, Graduate Environmental Officer Yara.

The survey of the Yara TAN lease was conducted on the 5th of April 2017. Above average rainfall had been received in January and February 2017 when 130.4 mm and 238.6 mm (a total of 369.0 mm) of rainfall were received respectively. This meant that grass species were in late flower/early seed stage and that later developing annual and perennial herbaceous species were in early flower so all weed species could be easily identified.

6. Taxonomy and Nomenclature

All species recorded were able to be identified in the field by the surveying botanist.

7. Results

7.1 Vegetation Condition - General

A discussion is given in the previous weed survey report (VLA 2017) with regard to deteriorating vegetation condition due to an increase in buffel grass between the Trudgen mapping in 2000 (Trudgen 2002) and the baseline survey report for the project (Outback Ecology Services 2010). In the 2017 report, VLA recorded a similar abundance of buffel grass present to that reported by Outback Ecology Services (2010). Three vegetation associations were described by VLA (2017) based on Muir (1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970) (Appendix A Table A.1) and vegetation condition is based on Trudgen (1988) (Appendix A Table A.2).

Since December 2016 there has been a significant die off of *Acacia bivenosa* on the south and eastern sides of the plant site. This is most severe on the southern side where the population mortality was recorded as 98%. Interestingly, no new seedlings have emerged in this population, which is the usual response to age related deaths of shorter lived acacia populations, to replace dead shrubs.

It is noted that currently local groundwater levels are at >10 year highs (as evidenced by bores on YPF site) and it is postulated that the saline groundwater associated with the King Bay Tidal flats have risen above the root level of the Acacia population, causing widespread mortality due to salinity and associated drought. Records over the past 45 years (Karratha Aero Station No 4083) indicate that, despite the somewhat erratic nature of rainfall events in the Pilbara, annual rainfall between 1972 and 1996 was relatively stable. During this period annual totals were generally between 180 – 280 mm, with the occasional exceptions (505 mm in 1973 and only 53 mm in 1983). It appears that between 1997 and 2017, rainfall has become more erratic and much higher total rainfall is being recorded more frequently (eg. 552 mm in 1999, 855 mm in 2006, 489 in 2009, 765 mm in 2011, 594 mm in 2013 and between January and March 2017, 415 mm was received). It is likely that during each of these years of major rainfall, saline groundwater beneath the near coastal areas would be mobilised by the substantial sub-surface flows which occur during and after heavy rainfall events. Additionally surface run-off from the surrounding ranges would dissolve salt in the

soil column deposited on these near coastal dunes due to their proximity to the sea, further causing the salinity of shallow groundwater to rise. Although *Acacia bivenosa* is known to be somewhat saline tolerant, it is probable that repeated saline impacts would eventually stress plants significantly. The regularity of the high rainfall events over the past 10 years would not allow plants to recover fully. This is hypothesis only as the populations have not been monitored over that period.

Vegetation as recorded in the December 2016 survey (VLA 2017) and its current condition in the area are described in Table 2.

Table 2: Vegetation descriptions for remnant vegetation east and south of Yara TAN plant site (within lease)

Code	Vegetation Description ¹	Condition ²
AbTtCc (2016) TtCc (2017)	Acacia bivenosa open (2-10%) to scattered (<2%) tall shrubland over open Trianthema turgidifolia low shrubland (2-10%) over Cenchrus ciliaris tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) Triodia epactia on sandy flats. Open Trianthema turgidifolia low shrubland (2-10%) over Cenchrus ciliaris tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) Triodia epactia on sandy flats.	Very Poor
СсТѕр	Cenchrus ciliaris closed tussock grassland (70-100%) with scattered (<2%) low shrubs of Tecticornia species and Trianthema turgidifolia fringing tidal inlet.	Completely Degraded
Tspp	Tecticornia species low open shrubland (2-10%) to scattered low shrubs (<2) on tidal inlet.	Very Good

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

7.2 Weed Species Recorded

No Declared Pests were found on the site (Appendix B Table B.1 and B.2)

Three weeds were recorded in the 2017 Tan lease survey, one being new to the Yara TAN Plant site.

Two plants of *Indigofera sessiliflora* were recorded on a rock batter along the south-eastern end of the plant site at GPS co-ordinate: 0477966E 7719316N. This weed is not listed by Hussey *et al* (1997) but is listed on FloraBase (DBCA 2017). It has previously been recorded at Port Hedland and Cape Preston. The earliest record of the plant is in 1991 (Keighery 2010). It has been observed growing on disturbed areas around Karratha, particularly near the coast (V Long *per obs*) and the author believes it is more widespread than indicated in FloraBase. It has been previously recorded by the author and others at Port Hedland.

The other weeds recorded were *Cenchrus ciliaris* (buffel grass) and *Aerva javanica* (kapok) and both species have been recorded in previous surveys. The Department of Biodiversity, Conservation and Attractions (DBCA) classify weeds in each region, termed "environmental weeds". These are weeds that may impact on natural, rather than agricultural or horticultural, values and are ranked based on

²Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

invasiveness, ecological impact, potential and current distribution and the feasibility for control. Weed rankings are shown in Appendix B Table B.3. The three weed species found on the Yara TAN site are classified as environmental weeds. The priority for management is defined by these risk rating categories (DPAW 2013).

With regard to the weed rankings, it should be remembered that they are formulated for the entire Pilbara region, much of which is under pastoral lease where buffel grass in particular is a highly valued fodder species. Both buffel grass and kapok are now widespread in the Pilbara and control is no longer a feasible option for the wider area. The Burrup Peninsula however, like some offshore islands, is still relatively weed-free apart from in the Industrial Zone. The vegetation types found on the Burrup Peninsula (Murujuga National Park) are not replicated anywhere else on the Pilbara mainland (Trudgen 2002). Put into context, the vegetation of the Burrup is unique and has high conservation value. Given this, the fact that Murujuga National Park is a tourist asset and the globally acknowledged heritage value of the rock art, the "High" ranking for both buffel grass and kapok on the Burrup should be taken seriously.

Table 3: Inventory of weed species recorded within the Yara TAN lease, weed policy classifications and recommended management options. (Australian Weeds Committee 2012; Department of Parks and Wildlife 2013)

Species Name (common name)	Classification ¹
Aerva javanica (kapok)	Environmental weed (High; D,E)
Cenchrus ciliaris (buffel grass)	Environmental weed (High, D)
Indigofera sessiliflora	Environmental weed (TBA)

¹Management actions that may be considered for each ranking are included in Appendix B.

Buffel grass and kapok were both recorded present in the Level 1 baseline survey conducted for the PER in March 2009 (Outback Ecology 2009). *Indigofera sessiliflora* was not recorded in 2009. *Vachellia farnesiana* recorded during that survey was not detected in this 2016 survey.

7.3 Cover and Life Stage

Plant Site

The plant site is comprised of two distinct areas: the operating plant area and the surrounding infrastructure, office and boundary areas.

The operating plant area is heavily gravelled which continues to result in very low weed presence (0-<1%).

The area peripheral to the operating plant area includes stony batters, office sites on surfaces of dirt or cracker dust, mostly dis-used laydown areas and an area of stockpiled soil. These areas had varying weed presence and, as would be expected following abundant summer rainfall, foliar cover and abundances were much higher than recorded in the December survey. Kapok and buffel were equally recorded this visit and densities ranged from 10% to 85% for both species, compared to December when kapok was the most recorded species with cover ranges from <1% to 20% and up to 60% at some weed record points and buffel, which was much less abundant (as would be expected at that time of year) ranged from <2% to 10%.

Buffel was generally recorded as flowering and seeding whilst the majority of kapok was in early flower stage.

Locations, abundances for each species, life stage of weeds recorded are given in Table 1 Appendix C. Because of the varied percent cover of both buffel grass and kapok at each location, a density range was developed which considers the total weed cover at each location where the record was made. Cover ranges are:

Description	% Cover in area assessed
Very Dense	80-100
Dense	60-80
Moderate/Dense	30-60
Moderate	10-30
Sparse	2-10
Scattered	0-2

Total % cover of buffel grass and kapok are mapped within these ranges in Appendix D Figure 1. The map references should be cross referenced with Table 1 in Appendix C which indicates the individual abundances of kapok and buffel separately at each weed location point.

Lease area south and south east of Plant Site

The area outside the plant site fence (but within Yara TAN's lease) to the east and south east was heavily infested with buffel grass. Both areas had an estimated buffel grass cover of 70% to 90% of the total area and kapok varied from 10% to 60%. Locations, abundances and lifestage are included in Table 1 Appendix C and range abundances are mapped in Appendix D Figure 1.

7.4 Comparison with Previous Weed Mapping

The Scope of Works requirement to compare the type and abundance of weeds to the baseline survey (2009) can only be done superficially for reasons described in VLA report (January 2017).

Weed mapping was conducted in July and October 2013 and a map is included in the Compliance Report for Weed Management Attachment 04 *Weed Mapping Report* (Tecnicas Reunidas 2014). The map does show the location of buffel and kapok and "fumigation" efforts in 2013 but does not indicate abundance.

From the previous literature available, it appears that the locations of buffel and kapok within the plant site area have remained the same but there has been further spread into the western side of the plant site and along the access road into the site since 2013. A comparison of species abundance cannot be commented on. The area outside the plant site, on the eastern and southern sides of the lease appears to have remained constant, given that no Vegetation Condition Scale was referred to in that report, since the baseline survey in 2009.

The MS870 Condition 6.1.6 states "The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring .." As Yara have not undertaken any specific revegetation to date, the Scope of Work requirement to compare current abundances with baseline survey goes beyond compliance and shows environmental integrity.

A weed map is presented in Appendix D Figure 1.

A description of weeds found during the survey on both the Yara TAN plant and Yara Ammonia plant, and potential weed species to be alert for are presented in Appendix E.

1. Discussion and Recommendations

One new weed was recorded in the Yara TAN lease area this survey. *Indigofera sessiliflora* has not been recorded on the lease or the wider Burrup previously.

• It is recommended that the two plants recorded be removed immediately and that the surrounding area be thoroughly searched for any others. These can be hand pulled.

The weed rankings for both kapok and buffel grass have recently been elevated to "High" by DBCA, however the management options (DPaW 2013), which have not been correspondingly reviewed, remain for both weeds as "D – Protect Priority Sites" and "E – Targeted control to reduce infestations at priority sites". Given the high conservation value of the vegetation of the Burrup Peninsula, these management options to keep weeds contained and or controlled within the Yara TAN plant site is sound environmental practice. In saying this the eastern and southern area beyond the plant site are now in very poor to degraded condition and it is not likely that buffel grass could be controlled in this area, nor would it be cost and time effective to do so. Based on the results of this survey the following recommendations are made.

- Yara TAN consider a weed program for each species based on risk, time and resources to ensure effectiveness of weed control.
- Within the plant site, both buffel grass but particularly kapok should be controlled. Lower
 priority can be given to gravelled areas, and high priority to the outer boundaries of the
 plant site particularly along the northern and western boundaries.
- Control methods and timing should be undertaken according to a Weed Management Plan which will indicate best times for treatment.
- The eastern and southern area outside the plant site area should be monitored at appropriate times and following sufficient rainfall to check for any new weed incursions only. Control is not considered viable in this area.
- A weed audit to check for new weed incursions and to assess the effectiveness of weed treatment should be done annually as dictated by a Weed Management Plan.

APPENDIX A Vegetation Description Scale and Vegetation Condition Scale

Vegetation Structural Classes¹

Table A.1 Vegetation descriptions based on Muir (1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970)

Stratum	Canopy Cover (%)								
	70-100%	30-70%	10-30%	2-10%	<2%				
Trees over 30 m	Tall closed forest	Tall open forest	Tall woodland	Tall open woodland	Scattered tall trees				
Trees 10-20 m	Closed forest	Open forest	Woodland	Open woodland	Scattered trees				
Trees under 10 m	Low closed forest	Low open forest	Low woodland	Low open woodland	Scattered low trees				
Shrubs over 2 m	Tall closed scrub	Tall open scrub	Tall shrubland	Tall open shrubland	Scattered tall shrubs				
Shrubs 1-2 m	Closed heath	Open heath	Shrubland	Open shrubland	Scattered shrubs				
Shrubs under 1 m	Low closed heath	Low open heath	Low shrubland	Low open shrubland	Scattered low shrubs				
Hummock grasses	Closed hummock grassland	Hummock grassland	Open hummock grassland	Very open hummock grassland	Scattered hummock grasses				
Grasses, Sedges Herbs	Closed tussock grassland / bunch grassland/ sedgeland / herbland	Tussock grassland / bunch grassland /sedgeland / herbland	Open tussock grassland / bunch grassland /sedgeland / herbland	Very open tussock grassland / bunch grassland /sedgeland / herbland	Scattered tussock grasses / bunch grasses/ sedges/ herbs				

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

Vegetation Condition Scale¹

Table A.2 Vegetation Condition Scale based on Trudgen M.E. (1988)

E = Excellent

Pristine or nearly so; no obvious signs of damage caused by the activities of man.

VG = Very Good

Some relatively slight signs of damage caused by the activities of man. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks.

G = Good

More obvious signs of damage cuased by the activities of man, including some obvious impact on the vegetation structure such as that caused by the low levels of grazing or by selective logging. Weeds as above plus some more aggressive weeds.

P = Poor

Still retains some basic vegetation structure or ability to regenerate to it after very obvious impacts of activities of man, such as grazing, partial clearing (chaining) or frequent fires. Weeds as above plus some more aggressive weeds.

VP = Very Poor

Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species including very aggressive species.

D = Completely Degraded Areas that are completely or almost completely without any native species in the structure of their vegetation: ie areas that are cleared or "parkland cleared" with their flora comprising weed or crop species with isolated native trees or shrubs.

¹Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

APPENDIX B Weed Classifications

Weed Classifications

Weeds of National Significance (WONs)

Thirty-two WoNS have been agreed by the Australian State and Territory governments, based on the weed species' invasiveness, potential for spread and environmental, social and economic impacts (Australian Government, 2011). In Western Australia, many WoNS are also declared pests under the BAM Act.

Declared Pests

The Department of Agriculture and Food Western Australia (DAFWA) regulates weeds under the Biosecurity and Agriculture Management Act 2007 (BAM Act), which supersedes the Agriculture and Related Resources Protection Act 1976. Weeds are grouped into four main classifications (Table 1).

Table B.1: Categorisation of plants under the BAM Act

Category	Description
Permitted organisms under section 11	Organisms that are allowed entry into Western Australia
Prohibited organisms under section 12	Organisms that are prohibited from entry into Western Australia
Unlisted organisms under section 14	If an organism cannot be categorised as either permitted or prohibited the organism will be unlisted
Declared pest under section 22	Pests that may be in the State but are under official containment, control or eradication

Plants that are prevented entry into the State or have control or keeping requirements within the State are declared pests. Declared pests can be assigned to a C1, C2 or C3 category under the BAM Act Regulations 2013. Prohibited organisms can be assigned to a C1 or C2 control category (Table 2).

Table B.2: Categories of declared pests under the BAM Act regulations.

Category	Description
C1 Exclusion	Plants which should be excluded from part or all of Western Australia.
C2 Eradication	Plants which should be eradicated from part or all of Western Australia.
C3 Management	Plants that should have some form of management applied that will alleviate the harmful impact of the plant, reduce the numbers or distribution of the plant or prevent or contain the spread of the plant.

Landholders, managers and occupiers of land are responsible for the management declared pests on their land. The Western Australian Organisms List contains information on the area(s) in which a pest is declared and the control and keeping categories to which it has be assigned in Western Australia.

Environmental Weeds

The Weed Prioritisation Process for the Department of Biodiversity, Conservation and Attractions (DBXA) prioritise weeds in each DBCA region. The process ranks weeds based on their invasiveness, ecological impact, potential and current distribution and the feasibility for control. Within each region, each weed species has been ranked by risk. Table B.3 (DBCA 2016).

Table B.3: Weed species rankings (DBCA) 2016.

Weed Species Ranking	Objective	
VH – Very High	Eradication	
H - High	Eradication or control to reduce	
M – Medium	Control to reduce or containment	
L – Low	Containment at key sites only	
N - Negligible	No action to be undertaken but may include monitoring only	

The weed ranking includes examples of management actions that may be appropriate. Management actions that can be applied are presented in (Table B.4) (Parks and Wildlife 2013).

Table B.4: Examples of management actions that may be considered for each ranking (Parks and Wildlife, 2013).

Management Code	Explanation
А	No action (the weed species ranking is so low as to not warrant any investment in regional strategic management actions)
В	Monitor only (aims to detect any significant changes in the species' weed risk or management ability)
С	Improve general weed management (aims to minimise weed impact and maintain the overall biodiversity, social, cultural and economic values on the region through improved general weed management
D	Protect priority sites (aims to prevent spread of weed species to key sites/assets of high biodiversity, social, cultural or economic value)
E	Targeted control to reduce infestations at priority sites (may include biocontrol) (aims to significantly reduce the impact of a weed species on key sites/assets of high biodiversity, social, cultural or economic value through targeted management)
F	Contain regional spread (aims to prevent the ongoing spread of the weed species in the region)
G	Reduce regional infestations (may include biocontrol) (aims to significantly reduce the extent of the weed species in the region)
Н	Regional eradication (aims to remove the weeds species from the region)
1	State-wide eradication (aims to remove the weed species from the State)

APPENDIX C Weed Locations, Abundances, Life Stage And Map Reference

APPENDIX C Table C.1: YARA TAN PLANT WEED SURVEY – FIELD DATA AND MAP REFERENCE

APPENDIX D
Weed Map

APPENDIX E Weed Descriptions – Weeds Occurring on Yara Site and Potential Weeds

WEEDS OCCURRING ON YARA SITE AND POTENTIAL WEEDS.

Species Description

OCCURS ON BOTH TAN AND AMMONIA SITES

Common Name: Kapok Scientific Name: Aerva javanica Family: Amaranthaceae

Description: An upright herbaceous plant or small shrub 30 - 150 cm tall. Stems and leaves are densely covered in whitish woolly hairs. It has simple leaves, alternate along stems; shape varies from long and narrow to almost roundish. The whitish flowers are borne in elongated finger-like clusters at the tips of the branches. Separate male and female flowers are borne on separate plants, males are generally more slender. The flowers are stalkless, and have 3 very woolly white bracts which almost hide the 5 small petals. The tiny capsule like fruit contain a single back or brown shiny seed.

Kapok is in the same family as the mulla mullas which also like disturbed areas.

Origin: Native to northern Africa to south west Asia.

OCCURS ON BOTH TAN AND AMMONIA SITES

Common Name: Buffel Grass **Scientific Name:** *Cenchrus ciliaris*

Family: Poaceae

Description: A tall vigorous perennial tussock grass, can be small and wispy or dense tall tussocky plants. Appears very quickly after summer rains. Stems are branching 30-130 cm long, tough, smooth. Leaf blades are long and slender tapering to a point, green or blue-green, with a rough edge. Where they meet the stmem is a rim of hairs. They grow more from the stems than the base. Flower usually purple tinged. Seedhead is erect, straw, grey or purple coloured.

Origin: Native to tropical Africa

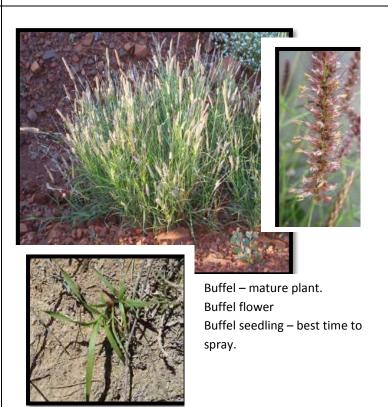

Photo

Kapok seedling – ideally spray at this stage.

Kapok in flower.

Species Description

Photo

OCCURS ON TAN SITE

Common Name: None

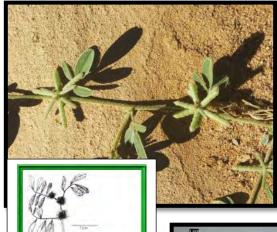

Scientific Name: Indigofera sessiliflora

Family: Fabaceae

Description: A small semi-prostrate (grows along the ground) annual or biennial herb. Leaflets 3-5 are small, grey-green covered in very dense long stiff hairs. The flowers are pale red (flowers September) and are partially enclosed in a very hairy calyx with long pointed tips. The legumes are cylinder shaped and covered in long hairs. They attach directly to the stem in clusters of 5-7.

Origin: Southern Asia

The plant is found on sand, dunes and disturbed situations along the coastline.

Indigofera sessiliflora plant with legumes; line drawing and mature legume with calyx.

OCCURS ON YARA AMMONIA SITE

Common Name: Bull Rush Scientific Name: Typha sp

Family: Typhaceae

Description: Tall robust plant with broad leaves to 2 m. Leaves grow in bunches from below water level. Flowering stems are stiff and grow erect from the centre of the leaf cluster. They bear oblong brown compact masses of tiny furry flowers hundreds of

which disperse when ripe.

The plant is very difficult to control due to prolific seed production and should be sprayed with glyphosate when actively growing before seed is set. Keighery claims both species of typha in WA are native but DPaW (Florabase) suggest control should be undertaken.

Origin: Unknown

Typha growing on the edge of King Bay mangal system.

Flowers produce prolific seed.

Species Description

RECORDED PREVIOUSLY BUT NOT CURRENTLY ON SITE*

Common Name: Mimosa Bush Scientific Name: Vachellia farnesiana

Family: Fabaceae

Description: Mimosa bush is a spreading shrub grows to 4 m tall The leaves are bipinnate (each leaf "branch" that comes off of a stem is divided into smaller "branches" which is each comprised of many leaflets) and have paired spines, up to 2.5 cm long, at their bases. Small, round, yellow flowers are produced in clusters, followed by cigar-shaped seedpods that start out green and turn black in colour.

It is distinguished from its look-a-like, Declared Pest Mesquite by the "warts" on its branches.

Origin: South America

*this was probably a mis-identification. It would probably have been the similar looking *Dichrostachys spicata* (native)

Photo

Mimosa Bush: habit

Mimosa Bush flower, seed pod and leaf.

POTENTIAL TO OCCUR ON SITE

Common Name: Wild gooseberry Scientific Name: Physalis angulala

Family: Solanaceae

Description: A much branched, almost hairless herbaceous shrub. It has a characteristic angled, hollow stem. Its light green leaves are more or less oval shaped with a slightly toothed edge. It has small pale yellow 5-sided flowers and a 3 cm long lantern shaped calyx enclosing the fruit.

Origin: Tropical America now spread throughout tropical and temperate regions of the world.

Flower and fruit of Wild gooseberry.

Species Description

POTENTIAL TO OCCUR ON SITE

Common Name: Tridax

Scientific Name: *Tridax procumbens*

Family: Asteraceae

Description: Low perennial herb with stems that spread horizontally before rising erect. Stems clothed in pale hairs. Has roughly oval shaped lobed leaves with stiff hairs. Small (to 10 mm) solitary flowerheads have cream ray florets (petal like) with a yellow centre (disc florets). The seeds are small 5-6 mm and featherlike, thus spread quickly in local winds.

Contact with this plant can sometimes cause skin irritation.

Origin: Native to central America, now widespread throughout tropics and subtropics.

Photo

Tridax habit, leaf and flower.

POENTIAL TO OCCUR ON SITE

Common Name: Stinking Passion

Flower

Scientific Name: Passiflora foetida

Family: Passifloraceae

Description: A climbing, scrambling rapidly spreading vine with sticky hairs and tendrils from the base of leaves. Leaves have three rounded lobes and vary from 2 to 5 cm long. Flowers are white and purple. Fruits are yellow to orange and contain numerous brownish seeds within a tasty flesh.

This species is rapidly spreading on the Burrup Peninsula and in the Karratha area generally.

Origin: native to southern USA, Mexico, Central America. Now a serious weed threat in the Kimberley.

Passiflora flower, vine and ripe fruit.

Project

Hi Rajan

Yara fertiliser Pilbara's proposed methodology appears to align directly with the Department of Parks and Wildlife's (Parks and Wildlife) Pilbara Region advice dated 23 April 2015. Parks and Wildlife has no further comments on the proposed bird deterrent methods.

Kind regards

Michelle Corbellini Environmental Project Coordinator Pilbara Region

Project

Hi Michelle,

Please find the attached document with regards to the information requested under your mail below as per your advice and it is related with overhead wires. Enclosed please see updated Bird Deterrent System Assessment report.

Please feel free to contact me for any further information. Your approval on the above is highly appreciated.

Subject: RE: Request to get approval of bird deterrents as per condition 7.1 of MS 870 of YARA PILBARA NITRATE

Project

Hi Rajan

Thank you for providing the Department of Parks and Wildlife (Parks and Wildlife) Pilbara Region with further information regarding Yara Fertilisers proposed bird deterrents at the Technical Ammonium Nitrate Production Facility, on the Burrup Peninsula, approved under Ministerial Statement 870. Ministerial Statement 870 includes the following requirement in relation to deterring birds from entering the contaminated water pond, clean water pond and sewage wastewater treatment station evaporation pond.

7-1 The proponent shall employ such structures and apparatus as are necessary and agreed by the DEC to deter birds from entering the contaminated water pond, clean water pond, and sewage wastewater treatment station evaporation pond.

Parks and Wildlife considers that the proposed deterrent techniques appear to be appropriate, provided that Yara Fertilisers commit to a monitoring program being developed and undertaken, to measure the effectiveness of the deterrent devices on the presence and abundance of bird species over time. If monitoring systems detect no effect of the devices, or a reduction in effectiveness is noted over time then other methods should be considered and implemented.

The preparation and implementation of a monitoring program is highly recommended as the effectiveness of ultrasonic and audio devices is variable, and highly dependent on how they are deployed, and dependent on target species present within the area. The range of sounds able to be detected between species varies markedly and the successfulness of an audio or ultrasonic devices in deterring birds can vary based on the activity that the bird is undertaking. There are concerns about relying solely on audio repellents for birds because they have not been demonstrated to be an effective long term solution. Some species become habituated to the devices over time. An effective deterrent system requires a variety of methods to be successful, whether in combination or in rotation, as well as frequently changing the type, timing and location of the equipment. Other deterrent methods which may be used in combination include, modifying the surface banks to make them less desirable to shorebirds (e.g. covering the banks with rocks to prevent nesting and foraging in the mud), or the installation of non-electrified string lines parallel across

the ponds to prevent birds from landing or entering the water. Trials at BHP's Olympic dam have been successful in using string lines spaced at 5m intervals to deter birds (reducing presence by 99.2%). These additional methods should be considered if monitoring detects that the devices are not effective, or are decreasing in effectiveness over time.

If you have any further queries please do not hesitate to contact me.

Kind regards

Michelle Corbellini

Project

Hi Michelle,

Please find the attached document with regards to the information requested under your mail below ref.: "Request to get approval of bird deterrents as per condition 7.1 of MS 870 of YARA PILBARA NITRATE Project", dated on 19/December/2014. We were trying to source out the information from the vendor, and we received the detailed information just recently.

Please feel free to contact me for any further information. Your approval on the above is highly appreciated.

Regards,

Rajan Sinha

Subject: RE: Request to get approval of bird deterrents as per condition 7.1 of MS 870 of YARA PILBARA NITRATE

Project

Hi Rajan

Thanks for your email and phone call to discuss yesterday.

I've had one of Parks and Wildlife's fauna experts review the deterrent methods proposed by Yara Pilbara Nitrate. They have requested that a bit more information is provided on how this method is implemented and what other options have been considered by Yara Pilbara Nitrate. If you could please provide the following information this would assist with a timely review of your request:

- State the model of the devices (i.e. brand, model number/series)
- Indicate the number of devices to be installed in total, and the number per pond, indicate the location of the installation on the map
- Indicate how the devices will be applied frequency of use
- Provide information on other deterrent methods/devices which Yara has considered. How were other options assessed to be appropriate or inappropriate in this circumstance? Examples of other methods include noise cannons, physical barriers etc. Were other methods considered to be applied in combination (i.e. more than one method)?
- State the common bird species at this site, which may use these ponds. This is required as it appears that certain species are more sensitive than others to these particular deterrent devices. The use of the device should be justified based on the bird species found in this area.

Please note that our fauna expert and I will be taking leave over the Christmas / New Year period, and therefore based on the supply of the above information we should be able to provide you with a response during January.

If you do have any questions please do not hesitate to give me a call on the number below.

Kind regards,

Michelle Corbellini

Hi Michelle,

Please note that YARA PILBARA NITRATE (YPNPL) is currently constructing a Technical Ammonium Nitrate Plant in Burrup Peninsula. You may get more information about this project in the website www.ypnpl.com.au. Please find the attached letter to get the approval of bird deterrents as per advice from Department of Environment Regulation.

Please feel free to contact me for any further information.

1. INTRODUCTION AND PURPOSE

Yara Pilbara Nitrates Pty Ltd (YPNPL) is developing a Technical Ammonium Nitrate Production Facility (TANPF) with a production capacity of (circa) 350,000 TPA or 915 MTPD of Technical Ammonium Nitrate (TAN).

The TANPF development site is located approximately 13 km northwest of Karratha and 1300 km north of Perth, on the Burrup Peninsula, Western Australia, within the Shire of Roeburne. The site for the TANPF is a 49 Ha area located adjacent to the existing Yara Pilbara Fertilisers Pty Ltd (YPFPL) Ammonia plant. The purpose of this document is to describe the process followed to identify, assess and install the bird control measure at TANPF in order to comply with Condition 870:M7.1 of the Environmental Ministerial Statement (MS) 870:

- "The proponent shall employ such structures and apparatus as are necessary and agreed by the DEC to deter birds from entering the contaminated water pond, clean water pond, and sewage wastewater treatment station evaporation pond".
- "Seek advice from DEC is required".

2. FAUNA BIRDS IDENTIFICATION AT TANPF

2.1 General

The Burrup Peninsula has a rich bird fauna, attributed to its complex topography and consequent diversity of habitats, i.e. Rock Piles, Grasslands, Intertidal, Supratidal, and Mangroves including inter-tidal and marine areas.

One hundred and sixty-eight (186) species are known from either the Burrup or from areas close by (DEC, 2006). Although the peninsula possesses no large permanent fresh-water wetlands, the salt ponds of the Dampier Solar Salt operation and the sheltered waters of the mangroves, creeks and small embankments all provide good localities for episodic visits by many waterbirds (DEC, 2006).

From the 186 species, some of them are considered as Conservation Significant fauna species listed under both the EPBC Act and the WC Act.

2.2 Conservation Significant Bird species

Migratory bird habitats within the Site are considered to occur in association with the saline supra-tidal flat that occurs through the centre of the Site. As this area is likely to be inundated after extreme tides, storm surges or after extended heavy rainfall, it is likely that this area would provide occasional foraging habitat in the period following these events. These species represents protected matters under the EPBC Act. Refer to Table 2-1. In addition to these species a number of migratory species listed under the JAMBA, CAMBA and ROKAMBA conventions have previously been recorded within the Burrup Peninsula or are known for the area (DEC 2006). These species also represents protected matters under the EPBC Act. Refer to Table 2-2.

Conservation Significant fauna species listed under both the WC Act which have a high or medium likelihood of occurrence within the Site are included in Table 2-3.

Table 2-1 EPBC Listed Migratory species - Conservation Significant Bird species which have the potential to occur within the Site

Species Name	Common Name	Habitat Requirements	Habitat Potential of the Site?

Table 2-3 WC Act Listed Species - Conservation Significant Bird species which have the potential to occur within the Site

Species Name	Gommon Name	Conservation WC Act	Habitat Requirements	Habitat Potential of the Site?
Falco peregrinus	Peregrine Falcon	S4	Nests on cliffs, crevice or large tree hollow. Occurs in a variety of environments including wetlands, plains and timbered watercourses (Pizzey & Knight 1997).	Site represents potential foraging habitat.
Ardeotis australis	Australian Bustard	P4	Grasslands, open shrublands and open scrublands. Species is relatively common away from settled areas (Pizzey & Knight 1997).	Species not previously recorded within the site or adjacent BNPL site.
Burhinus gralfarius	Bush Stonecurlew	P4	Open woodland, coastal scrub and mangrove fringes (Pizzey & Knight 1997).	Species not previously recorded within the site or adjacent BNPL site.
Numenius Madagascariensis	Eastern Curlew	P 4	Tidal mudflats, saltmarses and grasslands near water (Pizzey & Knight 1997).	Site represents potential habitat.
Phaps histrionica	Flock Bronzewing	P4	Flooded claypans, watercourses and treeless grassy plains, nest on the ground by low bush or tussock.	Site represents potential habitat.

WC Act Conservation Status:

S1 = Fauna that is rare or likely to become extinct. S4 = Fauna that is in need of special protection.

P1 = Taxa with few, poorly known populations on threatened lands. P4 = Taxa in need of monitoring.

2.3 Bird Survey on TANPF Site

ERM conducted a fauna survey (PER, Annex J) of Site D within the King Bay Hearson Cove Industrial Precinct on the Burrup Peninsula. The bird fauna observed is shown in Table 2-4.

The TANPF and temporary laydown areas had result in the removal of approximately 49 Ha of occasional foraging habitat associated with the supra-tidal flat. Areas of habitat would continue to exist to the south and west of the TANPF.

As such, the TANPF development is supposed to have implied the habitat loss of the migratory species now considered not having the potential to utilize the Site. Refer to the Public Environmental Review (PER).

Table 2-4 Bird Species Observed on Site

Species Name	Common Name
Birds	
Phaps chalcoptera	Common Bronze-wing Pigeon
Geopelia cuneata	Diamond Dove
Grallina cyanoleuca	Magpie Lark
Coracina novaehollandiae	Black-faced Cuckoo Shrike
Lichenostomus virescens	Singing Honeyeater
Larus novaehollandiae	Silver Gull
Himantopus himantopus	Black-winged Stilt*
Tringa nebularia	Common Greenshank*
Charadrius ruficapillus	Red-capped Plover*
Egretta garzetta	Little Egret
Sterna caspia	Caspian Tern
Megalurus timoriensis	Tawny Grassbird
Hirundo neoxena	Welcome Swallow
Artamus cinereus	Blackfaced Woodswalow
Hieraaetus morphnoides	Little Eagle*
Merops ornatus	Rainbow Bee-eater*
Egretta novaehollandiae	Whitefaced Heron
Nycticorax caledonicus	Nankeen Night Heron
Malurus lamberti	Variegated Fairy-wren
Actitis Hypoleucos	Common Sandpiper*

(*): EPBC Listed Migratory species - Conservation Significant Bird species

3. BIRD CONTROL METHODS IDENTIFICATION AND ASSESSMENT

3.1 Identification of Bird Deterrent Methods

The following available methods to deter birds have been identified:

- Physical Bird Control: Wire system, Bird Control Spikes, Bird Spiders, Hydroblast, Netting/Mesh.
- Electrical/Electronic Bid Controls: Audible Bird Control, Non Audible Bird Control Visual Bird Control, electrifier wire.
- Chemical Bird Controls (gels, avicides, fogging agents, etc.).

3.2 Assessment of Bird Deterrent Methods

Generally, all of the methods above listed have limited effectiveness requiring to carry out a decision making process to select a suitable bird deterrent system. Issues of installation and associated costs limit the choices even further. The factors considered when selecting a bird deterrent system for the ponds include the following:

- Bird species (including size, behaviour and habits);
- · Bird Control effectiveness.
- · Environmentally safe;
- Installation and Maintenance;
- · Number and size of ponds,

A netting system has been discarded as an accurate installation to be effective is very difficult, time consuming and expensive due to size of the contaminated ponds. Because of the big of the ponds (e.g. 3,000 m2), bridges are needed to be able to tension and support the mesh hence this is a huge impact that does not justify the purposes. Netting systems requires a difficult netting clean and maintenance. Chemical control, electrifier wirer and spikes are discarded due to the occupational health and safety regulations restrictions and potential harm to people, fauna and environment.

Sound bird control devices have been discarded due to the noise pollution originated: distress signals are generally very loud, thus disturbing the human inhabitants as well. There is also a possibility of habituation towards the noise. The effects are temporary in that birds may return after the distress signal is turned off. The 'silent' ultrasonic repellents were considered at first instance taking into account the following applications and advantages: effective against most species of birds identified under Table 2-4, eco-friendly ('green'), environmentally safe, non-toxic and non-harmful, easy to install, low clean-up and repair costs and acoustic environment for customers and employees. Nevertheless suppliers have recognised that ultrasonic device as their range and affect is limited outdoors, and are ineffective on many bird types or species become habituated to the devices over time.

Following recommendations from Department of Parks and Wildlife - Pilbara Region, YPNPL has investigated further other methods already implemented as modifying the surface banks to make them less desirable to shorebirds (e.g. covering the banks with rocks to prevent nesting and foraging in the mud), or the installation of non-electrified string lines parallel across the ponds to prevent birds from landing or entering the water. Trials at BHP's Olympic dam have been successful in using string lines hand effectiveness have been investigated by YPNPL. The BHP Billiton Olympic Dam project identified the suspension of parallel overhead wires above the evaporation ponds as a potential option to restrict wildlife interaction with the TRS. To test the effectiveness of this approach a trial was undertaken at a local waterbody. A series of wires/lines 1m above the water surface were installed on it for a period of three weeks, during that time the spacing between the lines was tested at different intervals (5m, 7m and 10m). The trial concluded that lines spaced at 5m intervals are capable of reducing the presence of waterfowl by 99.2%.

In addition, Department of Parks and Wildlife - Pilbara Region recommends that YPNPL should commit to a monitoring program being developed and undertaken, to measure the effectiveness of the deterrent devices on the presence and abundance of bird species over time. If monitoring systems detect no effect of the method (deviations to targets in reducing the number of listed migratory birds lost), or a reduction in effectiveness is noted over time then other methods should be considered and implemented whether in combination or in rotation.

4. NUMBER OF BIRD DETERRENT DEVICES AT TANPF'S

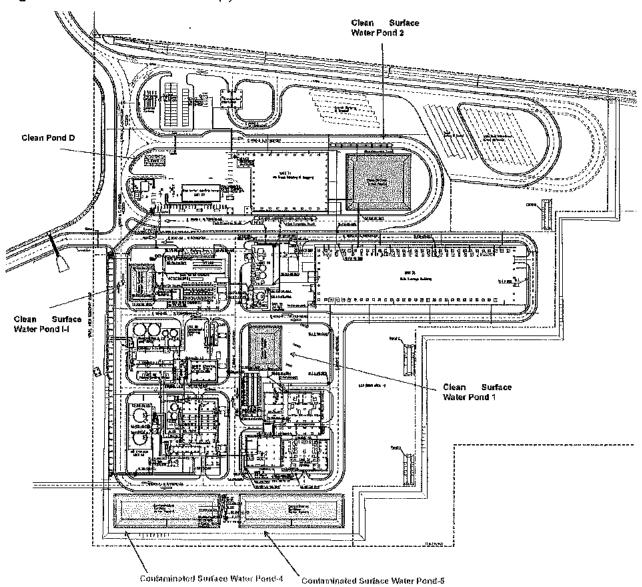

Based on the assessment undertaken under section 3.2 and recommendations made from Department of Parks and Wildlife - Pilbara Region, the methods considered to deter birds method from entering the contaminated water pond, clean water pond and sewerage wastewater treatment station evaporation pond are described in Table 4-1.

Table 4-1 Bird Deterrent Method (s) implemented on Site

·	Civil Drawing	Pond Dimension East-West	Pond Dimension North- South	Pond Surface	Bird Deterrent Method Measures

5. WIRE LINE SYSTEM TECHNICAL DETAILS

Stealth

HVAC . Gridwire

HVAC Netting System

HMAC units provide birds with sheller (underneath the units), and a high perch to check out food and other opportunities (on top of the units).

Roottop units can be difficult to protect. Installers generally screen off the bottoms; and put Daddi Long Legs on the top. The units need to be accessed for maintenance, and building owners generally don't like holes drifted in their roofs.

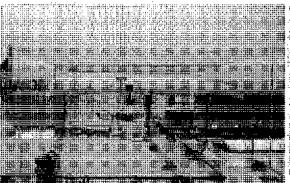

Our HVAC protection system offers many unique features:

* System protects top and space below the unit

- Ourner Stand-off brackets raise net well above unit
- Brackets keep not away from the sides of the unit as well
- Brackets can usually mount to unit without screws
- Weighted hose secures to roof, no fasteners or holes necessary
- · Hose can be lifted up for repair access
- installed using most standard Bird Barrier items (Steakhitet, cable, net-rings, tools etc.)
- Zippers can be installed for smaller access, or as pipes and other obstructions demand

EXECUTIVE SUMMARY

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Burrup Nitrates Pty Ltd (BNPL) in 2010 and 2011 to undertake hydrological and hydrogeological investigations of the proposed Technical Ammonia Nitrate Production Facility (TANPF), located at "Site D" within the Burrup Industrial Estate (BIE) on the Burrup Peninsula, Western Australia (WA).

This assessment was conducted to address Environmental Protection Authority Statement 870 Condition 8 Groundwater.

Desktop analysis and field assessment identified that the surface water at the proposed TANPF intersects a number of ephemeral watercourses which drain the slopes to the north. Diversion of these flows will be required.

Flood modelling undertaken by Golder (2011) indicates that water levels would rise to approximately 5.6 m AHD due to storm surge in a 100 year return interval event. This exceeds the proposed site level of 5.5 m AHD suggesting that some parts of the site could be inundated in such an event.

The groundwater assessment involved the installation of groundwater monitoring bores at the site, which were monitored over 18 months to evaluate baseline groundwater conditions. The average groundwater elevations across the site were 3.6 mAHD in late April 2011, and 3.4 mAHD in September 2011 and February 2012. Depth to groundwater ranged from over 3 mbgl in the northern, more elevated part of the site to approximately 0.5 mbgl in the supratidal flat area in the southern part of the site. The inferred groundwater flow direction was to the south-east, towards the supratidal flats in the southern part of the site where groundwater salinity is increased through evaporation and evapotranspiration. The hydraulic gradient was noted to be slightly steeper in the north-west than in the south of the site and groundwater elevation was generally noted to mimic surface topography.

Background groundwater quality at all monitoring well locations was dominated by sodium and chloride; however, groundwater from the northern (bedrock) part of the site contained more bicarbonate and calcium relative to chloride and sodium than groundwater from the southern part of the site. Salinity also increased in groundwater samples from the south of the site, consistent with the presence of the supratidal flats in this area.

Dewatering was considered as it formed part of one of the conditions of the EPA statement 870. The site may require dewatering during wet season or storm events, other dewatering activities will be determined by the installation methods finally chosen for the project.

Based on the findings of this report the following recommendations are made for further hydrological and hydrogeological assessment:

Further detailed design of upslope clean water diversion drains;

- Review flood modelling to address uncertainties with respect to assumed downstream water levels;
- Conduct additional flood modelling to assess the relative increase in flood magnitude, frequency and flow velocities caused by filling the floodplain. Related issues to be addressed include:
 - assess impacts on surrounding land, ecosystems and developments (both existing developments and any proposed or foreseen developments within the area);
 - assess impacts on groundwater conditions (quality and levels) and soil salinity;
 - assess compliance with relevant legislation and flood planning controls; and
 - review of mitigation options to reduce potential impacts.
- Determine onsite stormwater detention requirements for clean and dirty water catchments based on final site design and development conditions;
- Prepare stormwater management plans that address the management of clean and dirty stormwater, including any discharge procedures and water quality targets;
- If dewatering is to be considered for the site, pumping tests and assessment of groundwater elevation and quality in nearby observation bores should be conducted; and
- As part of detailed design, develop management plans for control of potential sources of on-site contamination. Such sources might include water, chemical and fuel storage facilities, waste water treatment facilities, and water and waste discharge processes.

1 INTRODUCTION

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Burrup Nitrates Pty Ltd (BNPL) in 2010 and 2011 to undertake hydrological and hydrogeological investigations of the proposed Technical Ammonia Nitrate Production Facility (TANPF), located at "Site D" within the Burrup Industrial Estate (BIE) on the Burrup Peninsula, Western Australia (WA) (*Figure 1.1*).

The studies undertaken focused on the 35 ha northern portion of Site D (hereafter referred to as 'the site') which is the designated area of disturbance (both permanent and temporary) for the TANPF (*Figure 1.2*).

These baseline studies are required in support of the environmental approvals process for the proposed TANPF.

1.1 PROJECT APPRECIATION

Site D within the BIE occupies an area of approximately 79 ha and extends from Village Road in the north to Hearson Cove Road in the south. The existing Burrup Fertiliser Pty Ltd (BFPL) ammonia plant is situated adjacent to the western boundary of Site D, with vacant land present between the site and Hearson Cove to the east.

The site (including temporary laydown areas) occupies approximately 35 ha of land in the northern section of Site D. Bulk earthworks disturbance associated with construction of permanent works for the TANPF will be constrained to approximately 16 ha of land (*Figure 1.2*) located within the western quadrant of the site.

The TANPF comprises three major processing units including a nitric acid plant, ammonium nitrate solutions plant and the technical ammonium nitrate (TAN) plant. The proposed site preparation works for the TANPF are anticipated to include the following activities:

- Removing vegetation within the designated area;
- Preparing the TANPF footprint and lay-down/stockpile areas, which will include cut and fill activities;
- Construction of a wastewater treatment plant;
- Installation of site drainage;
- Establishment of perimeter fencing;
- Road and access tracks for construction; and

Figure 1.2 Site Layout

Environmental Resources Management Australia Pty Ltd

Adelaide, Brisbane, Canberra, Hunter Valley, Melbourne, Perth,Port Macquarie, Sydney

The proposed civil works for the TANPF will include:

- Excavation for foundations and other minor civil works;
- Cut and fill activities;
- Controlled blasting (if required);
- Laying of concrete pads/footings;
- Equipment storage/construction laydown;
- Preparation of ammonia pipeline and utilities from the adjacent BFPL facility; and
- Site finishing activities (gravelling, asphalting, paving, drainage trenching etc.).

The potential impacts of the proposed development on the environment range from the direct impacts of clearing for the TANPF and associated pipe corridors, to indirect short and long-term impacts on the surface hydrology and groundwater regime during construction and operation of the TANPF.

The agreed scope of works to be completed by ERM also included an acid sulfate soil (ASS) assessment for the site, which has been reported separately (ERM, 2011).

1.2 OBJECTIVES

The agreed objectives of the hydrological and hydrogeological investigations are summarised as follows:

- To meet the requirements of Ministerial statement 870, condition 8;
- Assess peak flows for site runoff and flow to the site from the upgradient catchment to gain a preliminary understanding of the TANPF drainage design requirements to manage estimated stormwater drainage run off;
- Characterise baseline hydrogeological conditions, groundwater flow direction and groundwater chemistry, to inform the assessment of potential groundwater impacts during development and operation of the TANPF; and
- Develop a preliminary understanding of the risk of potential flooding and whether further surface water modelling and groundwater assessment is necessary.

1.3 REGULATORY CONTEXT

Requirements for the assessment and management of groundwater at the site were formally conditioned in Ministerial Statement No. 870 published on 7 July 2011. Condition 8 of the above-referenced ministerial approval articulates the following requirements, which must be implemented pursuant to the provisions of the WA *Environmental Protection Act 1986* in support of the construction and operation of the TANPF.

- 8 Groundwater
- 8-1 The proponent shall undertake detailed hydrogeological studies commencing at least 12 months prior to the commencement of construction to quantify groundwater quality, groundwater flow directions, and the depth to groundwater beneath the TANPF site and in surrounding areas.
- 8-2 The proponent shall develop appropriate management measures for dewatering to the satisfaction of the CEO on advice of the DEC and the Department of Water in the event that the information gathered from the hydrogeological studies required by condition 8-1 indicates that dewatering would be required during construction.
- 8-3 The proponent shall design, construct, and locate groundwater monitoring bores to the satisfaction of the CEO on advice of the DEC and the Department of Water, having regard for the outcomes of the hydrogeological studies required by condition 8-1 and the Department of Water's Water Quality Protection Note 30 on Groundwater Monitoring Bores.
- 8-4 The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.
- 8-5 In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels:
 - 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified;
 - 2. The proponent shall provide evidence which allows determination of the cause of the exceedance;
 - 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO;
 - 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and

- 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.
- 8-6 The proponent shall make the monitoring reports required by condition 8-5(5) publicly available in a manner approved by the CEO.

The findings of the hydrological and hydrogeological studies reported herein may be used in support of the discharge of ministerial sub-condition 8-1 in respect of establishing a baseline understanding of groundwater depth, flow direction and chemical quality characteristics at the site.

1.4 LIMITATIONS

The findings of this report are based on the scope of work outlined in this report. ERM performed the services in a manner consistent with the normal level of care and expertise exercised by members of the environmental profession. No warranties, expressed or implied, are made.

Subject to the scope of work, ERM's assessment is limited strictly to identifying typical environmental conditions associated with the subject property and does not evaluate structural conditions of any buildings on the subject property, nor any other issues. Although normal standards of professional practice have been applied, the absence of any identified hazardous or toxic materials on the subject property should not be interpreted as a guarantee that such materials do not exist on the site.

The information relating to the soil and groundwater conditions in this document is considered to be accurate at the date of issue. Subsurface conditions can vary across a particular site, which cannot be wholly defined by investigation. As a result, it is unlikely that the results and estimations presented in this report will represent the extremes of conditions within the Site. Subsurface conditions including impact concentrations can change over a limited period of time.

All conclusions and recommendations made in the report are the professional opinions of the ERM personnel involved with the project and, while normal checking of the accuracy of data has been conducted, ERM assumes no responsibility or liability for errors in data obtained from regulatory agencies or any other external sources, nor from occurrences outside the scope of this project.

ERM is not engaged in environmental consulting and reporting for the purpose of advertising sales promoting, or endorsement of any client interests, including raising investment capital, recommending investment decisions, or other publicity purposes. The client acknowledges that this report is for the exclusive use of the client, its representatives and advisers. The client agrees that ERM's report or correspondences will not be, except as set forth herein, used or reproduced in full or in parts for such promotional purposes, and may not be used or relied upon in any prospectus or offering circular.

2 SCOPE OF WORKS

To meet the project objectives, the following scope of works was completed in accordance with the approved proposal:

- Desktop assessment, which included reviewing relevant available reports (e.g. Golder Geotechnical Report, 2011), and other publically available data;
- Field investigation and field data analysis;
- Hydrological assessment;
- · Hydrogeological assessment; and
- Preparation of this report to summarise the findings of the hydrological and hydrogeological investigations.

Each scope of work described above is discussed in detail below.

2.1 DESKTOP ASSESSMENT

The desktop assessment included a review of the following:

- Geological and hydrogeological data to identify potentially sensitive surface water and groundwater features in and surrounding the site;
- Historical investigation reports for the site and nearby industrial development (in particular the recent Golder Geotechnical survey undertaken in 2011);
- Meteorological data; and
- Hydrological and catchment data.

2.2 FIELD INVESTIGATION

A field investigation was completed in January 2011, with follow-up groundwater monitoring and analysis in April and September 2011 and February 2012 to inform the hydrological and hydrogeological characterisation of the site. Baseline studies were undertaken to provide initial characterisation of hydraulic conditions, groundwater flow directions and background groundwater chemistry. The studies were designed to assist with identifying potential impacts during development and operation of the TANPF and providing a baseline status.

A comprehensive assessment and installation of a monitoring network has not been completed at this time for this project, as the design and layout of the TANPF and installation methods have not yet been finalised. As such these works undertaken for this report are considered to be an initial assessment.

A summary of the works completed for the field investigation are detailed below.

2.2.1 Health and Safety

All works were completed in accordance with ERM health and safety (H&S) procedures. This included the preparation of site works risk/hazard analysis documents and the preparation of an H&S plan to oversee safe work practices at the site.

An H&S meeting was conducted with BNPL's appointed driller prior to mobilisation to ensure appropriate procedures and safety measures were in place for the site visit.

ERM required BNPL's drilling contractor to comply with ERM H&S procedures and measures discussed and agreed in the H&S meeting prior to mobilisation. If, for any reason, ERM staff felt that BNPL's subcontractor was not complying with the agreed H&S procedures/measures, or ERM staff felt an action was unsafe, ERM staff reserved the right to stand down or postpone works until appropriate safety practices were in place.

2.2.2 Drilling and Groundwater Monitoring Well Installation

The intrusive works undertaken in support of geological and hydrogeological characterisation of the site comprised advancement of 10 soil bores to a nominal target depth of 3 m. At five locations, drilling was advanced at least 2 m beyond the water table to facilitate monitoring well installation and subsequent groundwater sampling and analysis. The location of the soil bores and monitoring wells are provided in *Figure 2.1*.

Additional exploratory holes were advanced across the site to aid geotechnical characterisation and assessment of foundation design parameters and dewatering constraints, under the supervision of Golder Associates (Golder, 2011). This supplementary data has been used by ERM to refine the understanding of the site, particularly in regard to groundwater occurrence and behaviour, and the assessment of potential dewatering management implications (per Ministerial Condition 8-2, see *Section 1.3*).

Hydraulic Testing

Slug tests (rising head tests) were completed at the site in April 2011 to assess the hydraulic conductivity of the underlying geology; however, due to the flooding at the site and unexpected field equipment failure, viable data were not obtained from these slug tests.

Repeat slug tests were completed during the September 2011 and February 2012 groundwater monitoring events. Three rising head tests were completed at each monitoring well to assess repeatability, with the exception of MW1 (February 2012) where the test was only repeated twice.

Prior to commencing each slug tests, the static water level was measured and recorded. A pressure transducer for measuring changes in water level was installed and a bailer was submerged below the water level. The water level was allowed to return to static levels before removing the full bailer in an instantaneous movement. The instantaneous drop in water level and subsequent recharge of groundwater into the well was measured by the pressure transducer. When the water level had returned to the initial static level the test was repeated. The duration of the test was dependent on the rate of water level recovery which, in turn, is dependent on the geological formation in which the well is installed.

The results of the analysis of the data are provided in *Annex H*.

2.2.3 Groundwater Sampling

The five groundwater monitoring wells (MW1-MW5) installed at the site were developed, purged and sampled in accordance with ERM's standard groundwater sampling protocols. Samples were collected and stored under full chain of custody procedures. QA/QC samples were collected and analysed in accordance with Australian Standard AS/NZS 5667.11:1998: Water quality – Sampling – Guidance on sampling of groundwater and the results summarised in *Annex I*.

2.2.4 Soil Sampling

Soil sampling was undertaken during advancement of all soil bores (SB1 to SB5) and monitoring wells (MW1 to MW5) (Figure 2.1). During drilling, soil lithology was logged by ERM field personnel in general accordance with the Unified Soil Classification System (USCS). Potential visual and olfactory indicators associated with acid sulfate soils were also recorded where apparent (e.g. soil colour, mottling, hydrogen sulphide odours). Full details of the implemented soil sampling procedures and associated analytical results are provided in the ERM report 'Preliminary Acid Sulfate Soil Investigation, Aug 2011' (ERM, 2011) and are not discussed further in this report.

2.2.5 Laboratory Analysis

Groundwater samples were analysed at ALS in Perth, which is a NATA approved laboratory for the schedule of analytes recommended by the WA Department of Water (May 2007) for hydro-geological assessments, as listed below:

- Field parameters including; temperature, pH, oxygen reduction potential, electrical conductivity and dissolved oxygen;
- Cations and anions including calcium, magnesium, sodium, potassium, phosphate, ammonia, carbonate, bicarbonate, chloride, sulphate, nitrate, nitrite and silica;
- Total dissolved solids, total hardness and total alkalinity;
- Dissolved metals including; aluminium, arsenic, cadmium, chromium, iron, lead, manganese, mercury, selenium and zinc; and
- Total petroleum hydrocarbons.

2.2.6 Data Management

All geological and chemical data obtained from the field investigation were incorporated into ESDAT data management software. This software allows automated processing and presentation of geological and chemical data in tabulated and graphical forms. ESDAT data was coupled with GIS and CAD to enhance the spatial representation of data.

2.2.7 Hydrological Assessment

Hydrological calculations were undertaken to assess peak flows in catchments draining onto the site. The methods outlined in *Australian Rainfall and Runoff: A Guide to Flood Estimation* (AR&R) (Pilgrim ed., 1987) were used. Both the Rational Method and Index Flood Method were used as described for the North West Pilbara region of WA.

An estimate was made of stormwater detention volumes for 24-hour storm events of various recurrence intervals to inform the design of on-site stormwater detention facilities.

A review of existing information relating to flooding and storm surge was also conducted and relevant information summarised.

3 INVESTIGATION FINDINGS

3.1 CLIMATE

The Burrup Peninsula lies at the western edge of the semi-desert tropical Pilbara region within Australia's arid zone. The seasonal variations in the region do not accord directly with the traditional four seasons of higher latitudes and the climate is characterised by two seasons:

- Fine, warm and dry winters from May to November; and
- Hot, summers with periodic, heavy rains from December to March.

The climate of this region is monsoonal and seasonally controlled by the meridional position of the large high pressure cells, which pass from west to east across the Australian continent (Osborne *et al.*, 2000). These pressure systems, with their anticlockwise wind circulation, migrate from latitudes of 25° to 30°S in winter to 35° to 40°S in summer (Pierce *et al.*, 2003). Strong easterly winds prevail in the winter due to the development and intensification of anticyclones over southern WA or South Australia. In summer, prevailing winds are generally warmer and from the northwest and southwest.

Long-term meteorological data (including rainfall, temperature, humidity and wind data) has been recorded since 1969 at the operations of Dampier Salt and Karratha Airport by the Bureau of Meteorology (BoM). A summary of the meteorological data over the period 1993 to present for the area around the Burrup Peninsula is presented in *Table 3.1*.

3.1.1 Temperature and Humidity

The annual mean maximum temperature at Karratha Airport meteorological station (located 10 km south of the Site) is 32.3°C, with an annual mean minimum of 20.8°C. A summary of climate data taken from Karratha Airport meteorological station is provided in *Table 3.1*.

Table 3.1 Summary of Climate Data for Karratha Aero (BoM, 2012)

Annual Average	32.3	20.7	48	43	9.2	290.6**	19.5	25.6

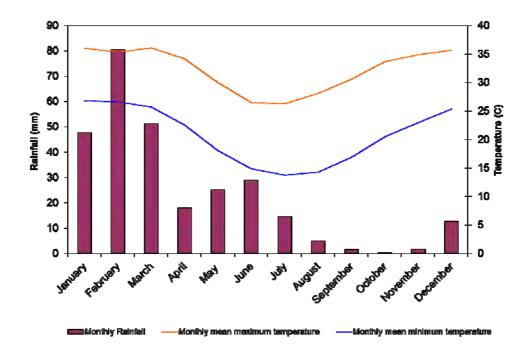

^{*} Data sourced from Dampier Salt meteorological station 1972 - 2012 (BoM, 2012)

Monthly mean maximum temperatures recorded range from 26.3°C in July to 36.1°C in March. Monthly minimum temperatures recorded range from 13.8°C in July to 26.8 °C in January (BoM, 2012).

The annual mean relative humidity is 48% at 9 am, decreasing to 43% at 3 pm. Monthly mean maximum humidity at 9 am range from 64% in February to 39% in August. Monthly mean maximum humidity at 3 pm ranges from 55% in February to 35% in August (BoM, 2012). Monthly mean maximum and minimum temperatures and rainfall are illustrated in *Figure 3.1*.

^{**} Average annual total

Figure 3.1 Monthly Mean Maximum and Minimum Temperature and Rainfall at Karratha Aero (BoM, 2012)

3.1.2 Rainfall and Evaporation

Annual rainfall in the region is characterised by low, highly variable and very localised rain events due to thunderstorm and tropical cyclone activity in the summer months. Average annual rainfall recorded at Karratha Airport is 289.9 mm, with an annual average of only 20 days a year exceeding 1 mm of rainfall (BoM, 2012).

Rainfall in the region is seasonal, usually with two peaks per year. The first peak is from January to March due to tropical cyclones, tropical lows or rainbearing depressions and tropical thunderstorms. The second peak is from May to June due to the passage of low pressure systems through the south of WA. Monthly average rainfall for the area ranges between 80.5 mm in February to 0.3 mm in October. Due to tropical cyclones, the area is prone to isolated extreme rainfall events. The highest rainfall recorded in a single month was 348.8 mm in February 2011, while all calendar months have at one stage recorded 0 mm of rainfall (BoM, 2012).

Annual average evaporation is 3,358 mm per year, or 9.2 mm per day, which is more than 11 times greater than the average annual rainfall (BoM, 2012).

On January 26 2011, Tropical Cyclone Bianca passed just north of nearby Barrow Island (approximately 150 km to the west of the site) bringing with it high winds and heavy rainfall. Damage to the weather station on the island meant that precise rainfall data for this event could not be ascertained. Following Tropical Cyclone Bianca, on 23 February 2011, Tropical Cyclone Carlos tracked over Barrow Island which resulted in a recorded daily rainfall of 283 mm.

As part of the field investigation, a site visit was undertaken by ERM personnel between the 28 and 30 April 2011. ERM personnel noted that there was evidence of temporal inundation in the low lying area east of the Burrup Fertilisers Pty Ltd (BFPL) Ammonia Plant (refer to the photolog in *Annex A*). A site visit conducted three months prior by the same ERM personnel noted that the same area was completely dry.

3.1.3 *Wind*

Winds in the area of the Burrup Peninsula are predominately from the east during the winter months of April, May, June, July and August with average wind speeds ranging between 17 – 24 km/h (BoM 2012). East to southeasterly winds are dominant in the mornings, shifting to north-easterly in the afternoon and easing in the evening in response to diurnal land temperature changes.

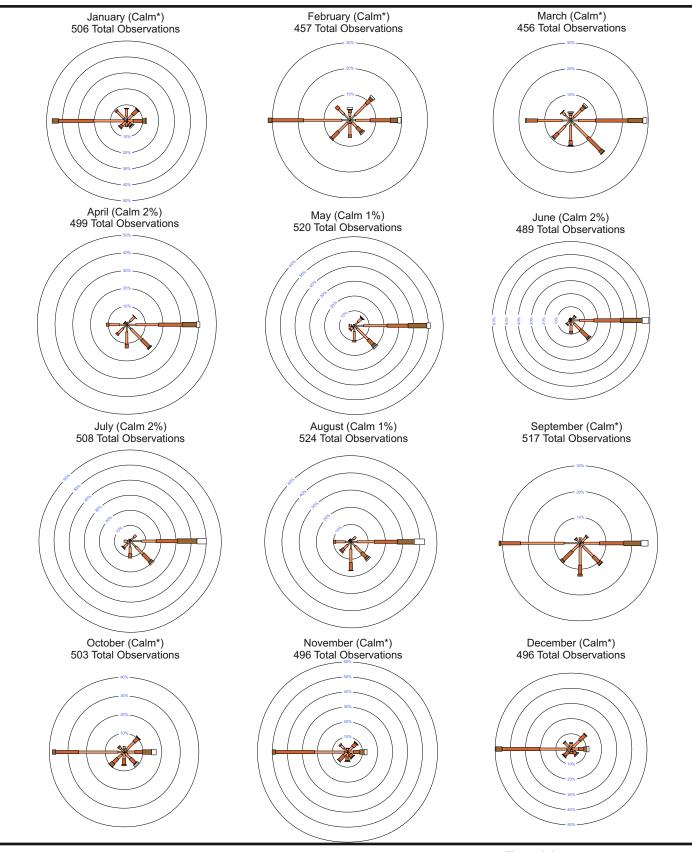

From October through to February winds are predominantly westerly in the morning, shifting to dominant north-westerly onshore winds in the afternoon with mean wind speeds varying between 19 and 30 km/h. The months of February, March and September are transition months with less dominant wind patterns, with mean wind speeds varying between 19 and 28 km/h. Monthly 9 am and 3 pm wind roses for Karratha are presented in *Figures 3.2* and 3.3.

Extreme wind conditions may be generated in the region by tropical cyclones, strong easterly pressure gradients, squalls and tornados. Tropical cyclones generate the most significant storm conditions in the region with wind gusts of 259 km/h at Mardie being measured during cyclone Trixie in February 1975, and 183 km/h recorded at Dampier from cyclone Orson in 1989 (BoM, 2011b).

3.1.4 Cyclones

The Pilbara coast experiences more cyclones than any other part of Australia and is one of the most cyclone-prone regions in the world. Between 1910 and 2006, 48 cyclones in the Karratha, Dampier and Roebourne region caused damaging wind gusts in excess of 90 km/h (BoM, 2011b). Along the central

Pilbara coast the cyclone season runs from mid-December to April peaking February and March as illustrated in <i>Figure 3.4</i> (BoM, 2011b).	in

On average, two cyclones cross the Pilbara coast each year, which can result in wind gusts of up to 250 km/hr, along with heavy swells, storm surges and torrential rain (BoM, 2011). Data from the BoM, as illustrated in *Figure 3.5*, summarise the frequency, category and maximum wind gusts from cyclones that have occurred in the Dampier and Karratha Region between 1910 and 2006. *Figure 3.6* shows the frequency of tropical cyclones per annum across Australia.

3.2 TOPOGRAPHY

3.2.1 Landforms and Topography

The Burrup Peninsula, approximately 22 km long and 5 km wide, was originally an island that formed part of the Dampier Archipelago. It was joined to the mainland in the mid 1960s by a road causeway, forming the Burrup Peninsula. The Burrup Peninsula is bound by Mermaid Sound to the west and Nickol Bay to the east and is distinguished by large areas of weather resistant rocky outcrops and scree slopes.

These high scree slopes form part of an extensive high scree range, which runs throughout most of the Burrup Peninsula and rises to 60 m above sea level in places, serving as the main catchment for water during rainfall events on the Burrup Peninsula.

Scree slopes and rocky outcrops exist to the north and south of the site, with steeply inclined valleys that occur along fault lines forming minor drainage lines, feeding into shallow drainage gullies through the site. These gullies then drain to the supratidal flats that run through the southern section of the site before flowing in a westward direction to King Bay.

The topography of the site is dominated by the supratidal flats that form an east-west trending valley at approximately 4 m Australian Height Datum (AHD) that divides the Burrup Peninsula into two separate units and extends from King Bay in the west to Hearson Cove in the east. The invert of this valley is composed of marine sediments.

The elevation of the site ranges between approximately 11.4 and 2.2 m AHD, with topography generally grading towards the south-east. The steepest area of the site is in the north-west section of the proposed development area, where the site gradient is approximately 1:15. Site topography is relatively flat in the southern section of the proposed development area. *Figure 3.7* presents topographical survey data for the site.

The five major landform features found on and adjacent to the site include:

- High scree slopes to the north and south;
- Uplands and upper hill slopes associated with the upper scree slopes bordering the northwest boundary of the site;
- Gentle, low, undulating hill slopes with occasional small rock outcrops and shallow drainage gullies;
- Tidal flats; and
- Tidal inlet and associated saline supratidal flats.

3.3 VEGETATION AND SITE COVERAGE

Vegetation coverage at Site D remains largely undisturbed as confirmed by Outback Ecology (2009) during a Level 1 vegetation survey conducted over Site D. Five main vegetation units were reported by Outback Ecology (2009) during their assessment and are discussed below, see *Figure 3.8*.

- **AbTeWa** (Coastal Flats) High Open to Open Heath of *Acacia bivenosa,A. coriaceae* subsp. *coriacea* over Low Open Shrubland over *Triodia epactia* hummock grassland and mixed Closed Grasses over Herbs on the coastal flats. The coastal flats run parallel to the saline inlet to the south and the lower hill slopes to the north and occur in the southern and northern portions of Site D. Soils here become more sandy and slightly saline.
- Sm (Saline inlet and Supratidal Flats) Tecticornia (syn. Halosarcia) spp. Scattered low shrubs to low open heath. Supratidal flats with Tecticornia-Trianthema succulent Dwarf Scrub. The saline inlet runs approximately east-west through the surrounding area.
- **ItTa** (**No Astron analogue**) *Indigofera trita* low shrubland over *Triodia epactia* (*T. angusta*) hummock grassland. One small occurrence of this unit is mapped in the south-east corner of Site D.
- **TeSv** (Coastal Flats) As noted in Trudgen (2002) this community is broadly described as *Sporobolus virginicus* grassland occurring on the edge of tidal flats. *Acacia bivenosa* occurs as a scattered shrub species while other associated species include *Trianthema turgidifolia* and *Eragrostis falcate*. This unit occurs in the north of Site D, and is mixed with **AbTeWa**.

AbImTe (Upland and Upper Slopes) Recorded on the Upper slopes of the northern part of Site D this community is described as an open *Acacia bivenosa* shrubland over gravel and stone. Additional shrub species present include *Indigofera monophylla*.

Vegetation condition was described as Very Good in the northern part of Site D to Degraded in the eastern and southern parts. The presence of *Cenchrus ciliaris* (Buffel Grass) an introduced species, was found to have an increased dominance and cover, based on consultation with consultants who surveyed Site D in 2000.

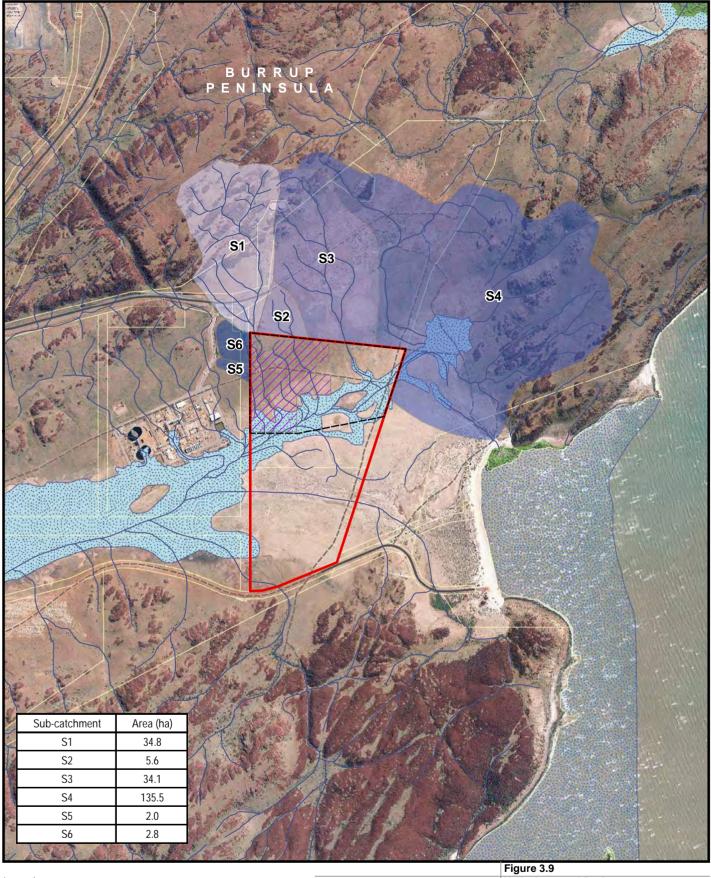

3.4 HYDROLOGY

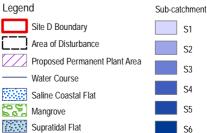

3.4.1 Regional Hydrology

As with much of the west Pilbara, the Burrup Peninsula has limited fresh surface water. Fresh water flows are highly variable, characterised by short periods of very high flow that coincide with major rainfall events usually associated with tropical cyclone activity. These periods of high flow are followed by dry periods sometimes lasting years, when stream flow stops and even deeper waterholes in gorges can dry up completely (DEC, 2006).

As such, there are no permanent surface water features on the Burrup Peninsula, as creeks and rock pools are ephemeral and, therefore, rainfall dependent. Topographical features suggest that surface water has historically flowed through the proposed TANPF site in a south-south-easterly direction in drainage channels that originate on the steep sided hillsides to the north as shown in *Figure 3.9*. These drainage channels fan out onto the lower level supratidal mud flats located in the south of the TANPF site, which drain westward to King Bay and Mermaid Sound. The soils of the lower slopes and tidal flats are highly permeable (SKM, 2001).

Natural drainage to the supratidal flat between King Bay and Hearson Cove from up-gradient is characterised by a rapid response to rainfall. This is due to the geology of the catchment, which limits rainwater infiltration, as well as vegetation that has little capacity for interception storage of rainwater. This rapid response to rainfall has been described in the Karratha Storm Surge Inundation Study (KSSIS) prepared by the Bureau of Meteorology Special Service Unit Report No. SSU96-7 (BoM, 1996).

Hydrology and Drainage

Environmental Resources Management Australia Pty Ltd Adelaide, Brisbane, Canberra, Hunter Valley, Melbourne, Perth,Port Macquarie, Sydney

Tidal Processes

During periods of extreme spring tides and storm surge the supratidal flats are periodically inundated with seawater for up to several hours. This tidal action supports the King Bay mangrove community west of Burrup Road by providing sedimentation, seawater recharge to maintain prevailing salinity fields, nutrient delivery and recruitment of benthos (Semeniuk, 1994). Evaporation of seawater over the tidal mudflats east of Burrup Road results in surface salinities ranging from 90,000 ppm to 300,000 ppm (Semeniuk, 1994).

The tidal range in the region is moderate and semi-diurnal in nature, with the tides in King Bay ranging from 0.1 m (LAT) to 5.2 m (HAT), which corresponds to -2.7 m AHD to 2.4 m AHD.

3.4.2 Storm Surge

Storm surge is the difference between the actual observed sea level and the predicted sea level. Wind stresses on the sea surface and a reduction in atmospheric pressure are the two main causes of storm surge (Department of Planning and Infrastructure (DPI), 2008).

Changes in sea level generated by extreme meteorological events, such as winter storms and cyclones, may be positive or negative depending on whether the sea level is higher or lower than predicted. The effect of storm surge is most severe when these extreme meteorological events occur in conjunction with high tide (DPI, 2008).

Storm surges, winds and rain associated with cyclones can cause considerable damage to coastal land and infrastructure in the Pilbara Region, with localised flooding possible in susceptible areas along rivers, creeks and low-lying areas, particularly when coinciding with a high tide (BoM, 2008).

Peak steady water levels have been estimated for a number of locations on the Karratha coast in the Karratha Storm Surge Inundation Study (BoM, 1996). The peak steady water level is the elevation of the sea surface above AHD caused by the combined effect of storm surge, tide and wave set-up. This water level is estimated to reach up to 5.0 m AHD within the vicinity of the TANPF Project site, for a 1-in-100 year event (BoM, 1996). The Burrup Road appears to be covered only at recurrence intervals around 100 years or greater (BoM, 1996).

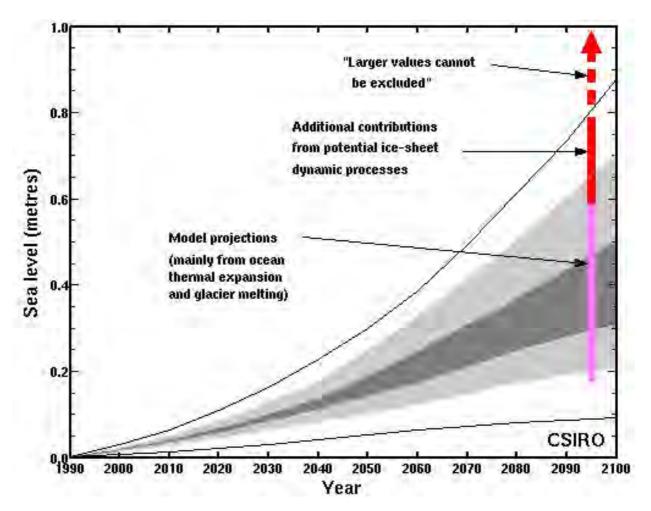

The interaction between storm surge and tides for the region is stated to be complex and non-linear. However results of the Karratha Storm Surge Inundation Study found that storm surges which exceeded 4.0 mAHD (1:50, 1:100 year events) were dominant over any tidal effects. In the event of a storm surge in this area, tidal effects can be considered negligible in favour of storm intensity and the location at which it crosses the coastline (BoM, 1996).

An investigation into the effect of rainfall runoff suggests that runoff generally does not greatly increase inundation water levels associated with storm surge except in more extreme events (BoM, 1996).

3.4.3 Potential Sea Level Rise

Based on the International Panel on Climate Change (IPCC) Third Assessment Report - 2001 (Church *et al.*, 2001), Fourth Assessment Report - 2007 (Meehl *et al.*, 2007) and interpretations from Hunter (2008), sea level on a global mean basis will rise between 6.7 and 20.8 cm by 2040 (*Figure 3.10* provides a graphical illustration of the predicted sea level rises and estimated contributions). This value is factored into the current proposed final TANPF level of 5.5 AHD.

Figure 3.10 IPCC Global Sea Level Rise Predictions (CSIRO, 2008)

3.4.4 Flooding

The supratidal flat, upon which the southernmost extent of the proposed TANPF is to be situated, hosts the water table aquifer in this area, and is likely to be subject to rapid flooding during high rainfall events. In addition, the supratidal flat between King Bay and Hearson Cove is known to be subject to flooding associated with storm surge events and with runoff during high rainfall events.

Golder (2011) indicated that to help mitigate potential flood impacts, BNPL propose to fill the site to achieve a typical level of 5.5 m AHD. Finished floor levels to buildings are indicated to be about 5.95 m AHD and road pavements will have a finished level of about 5.65m AHD.

ERM has reviewed flooding and storm surge data from two sources – the KSSIS (BoM, 1996) and Golder (2011). ERM's site observations from a recent inspection are also provided.

Groundwater conditions at the site are discussed further in Section 3.6.

Karratha Storm Surge Inundation Study (BoM, 1996)

The KSSIS (BoM, 1996) provides an estimation of storm surge for this region using a deterministic regional ocean model and historical cyclone events. The model did not account for the effects of sea level rise associated with climate change. This found that storm events with a return period of 100 years are expected to yield a storm surge of 5.0 mAHD, while storm events with a return interval of 50 years would result in a slightly lower rise in water level (4.6 mAHD).

The interaction between storm surge and tides for the region is stated to be complex and non-linear. However results of the KSSIS found that storm surges which exceeded 4.0 mAHD (1:50, 1:100 year events) dominated any tidal effects and, in this instance, tidal effects can be considered negligible in favour of storm intensity and the location at which it crosses the coastline.

Although it is reasonable to anticipate that flooding of this area will be exacerbated when high rainfall coincides with storm surges and/or spring tides, the KSSIS reported that rainfall runoff did not greatly increase water levels across much of the region except in the more extreme weather events, i.e. 1:100 storm events. It is however noted in the KSSIS study that an investigation of the relative frequency of extreme rain events coinciding with storm surge was beyond the scope of the study.

Golder Geotechnical Investigation (Golder, 2011)

The report Geotechnical Investigation: Proposed technical Ammonium Nitrate Production Facility, Burrup Peninsula (Golder, 2011) provides geotechnical and

hydrological information on the site based on site specific investigations and modelling. This included development of a HEC-RAS model to predict flood levels across the supratidal flats and assess flood-related constraints to development. It is noted that the Golder (2011) assessment does not consider impacts from predicted sea level rise associated with climate change.

The modelling found that the southern boundary of the site is flood affected and that the 100-year Annual Recurrence Interval (ARI) flood level is estimated to be approximately 5.6 m AHD. The HEC-RAS model assumed an input downstream water level of 5.6 m AHD, which is reported to be the maximum tide plus storm surge in the area (Golder, 2011). Model results for ARIs from 10 to 100 years all produce a water level of 5.6 m AHD, equal to the assumed input water level. This value is clearly controlling the model outcome.

ERM notes that the source of the 5.6 mAHD value for maximum storm surge height used by Golder is not well explained or justified. It appears that this figure is based on simple addition of the maximum tide level (reported as 2.5 mAHD) and recorded storm surge (3.1 m) from cyclone Orson in 1989. ERM suggests this approach is likely to be unreliable and may over-estimate the potential maximum storm surge height in the vicinity of the site. ERM believes a better source of information on storm surge height is the KSSIS (BoM, 1996). The KSSIS predicts peak steady water level caused by the combined effect of storm surge, tide and wave set-up, would reach an estimated 5.0 mAHD within the vicinity of the TANPF Project site (Burrup Road at King Bay-Hearson Cove), for a 1-in-100 year event (BoM, 1996). The KSSIS also reports that the combined effects of storm surge, wave set-up and tide are not linear and cannot be simply added as was done by Golder (2011).

Based on the information available ERM questions the use of 5.6 mAHD as a downstream water level. ERM similarly questions the validity of the flood model undertaken by Golder (2011) given that the assumed storm surge level dominates all results. ERM recommends that the flood modelling be reviewed and if necessary revised after considering more appropriate input data on downstream water levels. It may be advisable to produce a flood model that assumes lower downstream water levels, more similar to a typical tidal maximum, to investigate the magnitude of flood effects caused by overland flow from large rain events. These effects appear to be hidden in the current model outputs, being subordinate to the effects of storm surge.

Filling of the site for construction of the TANPF will reduce the flood storage capacity of the supratidal flats to the south. This could affect flood levels both onsite and in adjacent areas during flood events, and may be particularly pronounced during extreme rain events and high catchment runoff. This impact has not been modelled and should be quantified.

Further discussion regarding impacts and recommendations associated with this issue is provided in the *Sections 4* and 5 of this report.

During the site visit in April 2011, ERM observed indications of flooding across the low lying parts of the TANPF site related to extreme rainfall events caused by TC Bianca (January 2011) and TC Carlos (February 2011). There were indications that flood waters had reached a height of approximately 40 cm up the standpipe at monitoring well MW4. Ground level at MW4 is approximately 2.8 m AHD, suggesting water levels reached approximately 3.2 m AHD. It is not clear whether these levels were a result of very high tides, storm surge, overland flow, or a combination of factors.

3.4.5 *Catchment Peak Flows*

A number of ephemeral watercourses intersect the site, conveying stormwater from the rocky hill slopes to the north, in a south-easterly direction through the site and to the supratidal flats south of the TANPF. Six sub-catchments have been defined based on an interrogation of catchment drainage and focusing on watercourses that intersect the proposed development footprint. These sub-catchments have areas ranging from approximately 2 ha to 135 ha. *Figure 3.9* shows the relevant watercourses and their sub-catchments.

Peak flows within these sub-catchments were calculated for a range of ARI floods using the methods described in *Australian Rainfall and Runoff: A Guide to Flood Estimation* (AR&R) (Pilgrim ed., 1987). Both the Rational Method and Index Flood Method were used as described for the North West Pilbara region of WA. In relation to these methods and their applicability for use in WA, AR&R notes the following:

"It should be noted that the quality and quantity of the streamflow data used in deriving the methods vary considerably. The quality of the data is generally good in the South West region, but becomes poorer with distance from this more populous region. In particular the majority of gauging stations in the North West and Kimberley regions are poorly rated and have relatively short lengths of record. Hence, flood estimates derived for these regions using the methods given below should be treated with caution, especially for higher average recurrence intervals. The numbers of catchments used in deriving the various methods are rather limited, as are the ranges of data and characteristics sampled. These characteristics are therefore listed for each region to aid designers in assessing the accuracy of each method. Where the design conditions are outside the range of those sampled in derivation, the methods given in this Section are still recommended as the best available. However, it must be recognised that accuracy will be lower under these circumstances than when the design conditions fall within this range."

For the Pilbara region the Rational Method is based on historical flood flow data from 12 catchments with areas ranging in size from 40.5 km² to 7,980 km² and stream lengths from 10 – 194 km. The Index Flood Method is based upon data from 13 catchments with areas ranging in size from 40.5 km²

to 49,600 km² and stream lengths of 10 – 498 km. These catchments and stream lengths are all substantially larger than the sub-catchments and stream lengths being investigated here and this is likely to introduce increased errors to the calculations. The use of stream lengths and catchments areas that are less than the parameters upon which the peak flow equations were designed are also likely to increase the range of differences in results between the Index Flood Method and Rational Method.

AR&R provides the following caveat regarding the accuracy of the two methods:

The two methods are based on the same data in each region, and should therefore give similar results. The standard errors of estimate of the regressions for the runoff coefficients for the Rational Method are generally, but not always, slightly greater than those for the discharge in the Index Flood Method. However the differences would not be significant. Despite its slightly higher standard errors of estimate, the Rational Method should give more accurate results in most cases. The functional form of the relationships used in this method is likely to have greater validity than those used in the Index Flood Method for estimates involving combinations of catchment characteristics different from those used in developing the regressions. Also, most of the regressions for the runoff coefficient are for an ARI of 10 years, whereas most of those for the Index Flood Method are for the 2 or 5 year ARI Flood. In both cases, floods of larger ARIs are obtained by multiplication by a frequency factor, which also has a standard error of estimate. Although their values are not specified in the methods, the likely errors would increase as the extrapolation accounted for by the frequency factors increases. Most design floods have ARIs greater than 10 years, so that the Rational Method would generally involve less extrapolation and less error due to this cause. This does not apply to the Pilbara Region, where the ARI of the regression for the rational method is less than that for the Index Flood Method, and the latter may therefore be more accurate. It is not really possible to determine which method is more accurate for the Pilbara and Kimberley regions, as a result of the small amount of data on which the design relations are based.

In regard to the Index Flood Method in particular AR&R states the method uses 'regressions which are limited in their functional forms to relations that lack a sound physical basis. They are likely to give poor results when extrapolated beyond the range of values used in their derivation, but also beyond the range of combinations of values used'.

Although the two methods (Rational and Index Flood) are reported in AR&R to give similar results, this was not the case for the small catchments modelled here.

Comparison of the peak discharges produced from the Rational Method with the Index Flood Method shows larger peak discharges produced from the Rational Method. For 2 and 5 yr ARI events the peak discharges produced from the Rational Method are almost double those of the Index Flood Method. The peak discharge for the 10 yr ARI event produced from the Rational Method is approximately three times greater than the Index Flood Method. The 20 yr ARI peak discharge produced from the Rational Method is approximately 2.5 to 3.6 times greater than that produced from the Index Flood Method. The 50 yr ARI peak discharge produced from the Rational Method is 2-3 times greater than that produced from the Index Flood Method. For conservatism and in the absence of more detailed modelling data, it is recommended that the Rational Method data be used to inform initial considerations relating to stormwater management by BNPL.

Sub-catchment peak flows have been calculated using both methods described in AR&R and for ARIs ranging from 2 to 50 years. The results are presented in *Table 3.2*. It is noted that AR&R only assigns frequency factors for ARIs from 2 to 50 years. As such, the method has not been used to calculate peak flows for ARIs outside this range.

Copies of the calculation spreadsheets, including a description of the formulae and terms used, are contained in *Annex B*. Also provided in *Annex B* is an Intensity-Frequency-Duration (IFD) chart developed for the site using the Bureau of Meteorology's online IFD program which was accessed on 26 July 2011, at:

http://www.bom.gov.au/hydro/has/cdirswebx/cdirswebx.shtml

3.4.6 Onsite Water Management

The following wastewater drainage systems are proposed for the clean and dirty catchments at the site:

• Clean Runoff:

- Condensate from Air Chillers in TAN Unit;
- Boiler blowdown from Nitric Acid Unit;
- Purified process condensate; and
- Chiller condensate.
- Potentially Contaminated Runoff:
 - potentially recoverable waste water (high concentration of ammonium nitrate) from AN Neutralisation Unit, TAN Unit and Off-spec Unit;
 - potentially contaminated surface water in process areas (rain water, flushing and cleaning); and
 - oil contaminated waters (caused by spills and other accidents in process areas);

A cleanwater pond and contaminated water pond will be constructed to treat the aforementioned runoff streams. The cleanwater pond will collect rainwater from roofs and parking areas. Condensate from air chillers in the TAN Unit will be sent to the sea water basin. All potentially contaminated runoff will be directed to the contaminated water pond.

Areas inside process units will be paved and bunded to ensure collection of spills, washdown water and surface water. These areas will be connected to the underground pipe system and will be sent to the Waste Water Unit for treatment. The waste water unit will consist of an oil water separator and pH neutralisation system. The neutralised water will then be sent to the Contaminated Water Evaporation Pond. Cleaning residual salts from the Contaminated Water Evaporation Pond will be required as necessary.

The locations of the ponds and the onsite drainage plan are shown in *Annex C*.

3.4.7 *Onsite Stormwater Detention Requirements*

Two separate stormwater systems are planned; one for stormwater runoff from clean areas, and one for stormwater runoff from dirty areas. Clean stormwater catchments include roofs, paved areas, roads and unsealed (gravel) surfaces. Dirty stormwater catchments include all areas where stormwater could be contaminated, and includes bunded material storage areas. The clean and dirty stormwater catchments will be segregated and managed separately.

Within the scope of this assessment ERM was asked to consider the potential stormwater detention volumes required to capture site stormwater during 24-hour rainfall events with ARI's of 50 and 100 years. These calculations have been undertaken for both the clean and dirty stormwater catchments.

hour rainfall events with ARI's of 50 and 100 years. These calculations have been undertaken for both the clean and dirty stormwater catchments.

Based on the preliminary drainage plan (see $Annex\ C$), catchment areas for the clean and dirty stormwater catchments are estimated as 21,000 m² (2.1 ha) and 600 m² (0.6 ha), respectively. It is noted that there may be minor changes in the final areas upon confirmation of the final plant layout and design.

To estimate 24-hour detention volume requirements, the volumetric runoff from the site was calculated for various ARIs by multiplying rain depth by site area. A runoff coefficient of 1.0 was used, which assumes that 100% of rainfall converts to runoff. This is a reasonable assumption during high intensity rain events where a large proportion of the catchment is relatively impervious.

From the IFD chart (*Annex B*), 24-hour rain intensities for ARIs of 50 and 100 years, are 13.5 mm/hour and 16.5 mm/hour, respectively. This equates to 24-hour rain depths of 324 mm and 396 mm, respectively.

Table 3.3 lists the 24-hour runoff volumes for each catchment for ARIs ranging from one to 100 years.

 Table 3.3
 Runoff Volumes for Onsite Stormwater Detention

ARI, Y	24-hour Rainfall	24-hour	Runoff Volume		
	Intensity, I _{Y,24}	Rain depth	Clean catchment (Area = 2.1 ha¹)	Dirty catchment (Area = 0.6 ha¹)	
(years)	(mm/hour)	(mm)	(megalitres, ML)	(megalitres, ML)	
1	2.4	57.4	1.2	0.3	
2	3.4	81.6	1.7	0.5	
5	5.9	140.4	2.9	0.8	
10	7.7	184.6	3.9	1.1	
20	10.0	240.0	5.0	1.4	
50	13.5	324.0	6.8	1.9	
100	16.5	396.0	8.3	2.4	

¹ The catchment areas these volumes have been calculated from may be altered upon final design.

For the clean water catchment with an estimated area of 2.1 ha, the 24-hour detention volumes are approximately 6.8 ML for a 50-year ARI event and 8.3 ML for a 100-year ARI event. For the dirty water catchment with an estimated area of 0.6 ha, the 24-hour detention volumes are approximately 1.9 ML for a 50-year ARI event and 2.4 ML for a 100-year ARI event.

Recent correspondence with the DEC has identified that ponds will be sized and designed for all operational requirements and conditions, including cyclones. Ponds will be protected around the perimeter with a bund of 300 mm in order to avoid water from surrounding areas entering the ponds. Both the clean and contaminated water ponds will be evaporation ponds. A

back-up contaminated water pond is planned. Preliminary design pond sizes are provided below:

Clean Water Ponds:

- Pond 1: 32.4 m x 26.9 m x 2.6 m;
- Pond 2: 52.1 m x 29.6 m x 2.9 m; and
- Pond 3: 39.2 m x 31.2 m x 2.8 m.

The total volume provided by these three ponds is 10.2 ML which is of sufficient capacity to accommodate runoff estimated to be produced from the 1:100 yr 24 hr ARI storm event described above (8.3 ML).

Contaminated Water Pond:

• 63 m x 35 m x 3 m (2 ponds). One pond would be sufficient to accommodate the 1:100 yr 24 hr ARI storm event described above (2.4 ML).

All ponds will be lined with an elastomeric membrane to avoid leakage to and potential contamination of groundwater and surrounding soils. The clean water pond will also be lined despite not posing a contamination risk.

3.5 GEOLOGY

3.5.1 Regional Geology

The 1:250,000 series Australian geological map for Dampier-Barrow Island suggests that the site is likely to overlie surficial marine muds and coastal sand beach deposits. *Figure 3.11* presents the regional geology for the Burrup Peninsula. The 1:50,000 series Nickol Bay-Legendre sheet shows the surficial regional geology comprises the following:

- Holocene mud and silts on supratidal to inter-tidal flats, including areas of mangroves;
- Pleistocene red-brown silty sand in the north area of the site; and
- Proterozoic Gidley Granophyre bedrock.

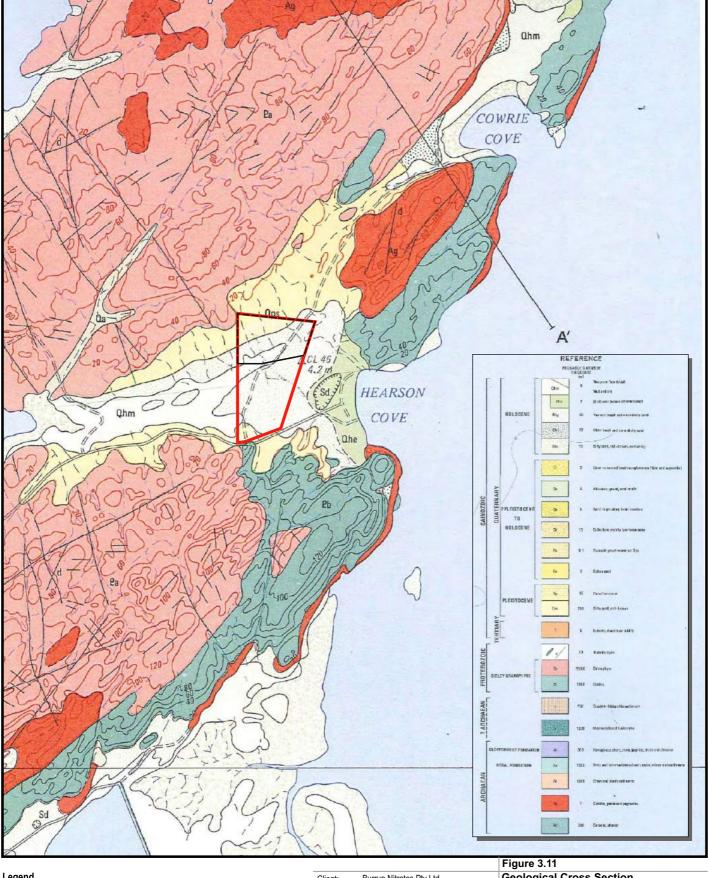

The geology of the Burrup Peninsula has been previously investigated by the Geological Survey of WA and has been described by O'Brien Planning Consultants (1994).

The Burrup Peninsula is composed mainly of an intrusive Proterozoic igneous rock outcrop known as the Gidley Granophyre, which is approximately 2,200 million years old. The main outcrop of Gidley

Granophyre occurs in the Dampier Archipelago and the adjacent mainland, along a basal unconformity of the Fortescue Group (Hickman, 1983).

The base of the intrusion consists of a differentiated coarse-grained gabbro and the main body is a fine-grained granophyre. The gabbro weathers to a dark brown and the granophyre to a lighter red-brown; both rock types are resistant to erosion and form aggregates of split boulder screes.

Rapid weathering of dolerite dykes that are also present has resulted in the formation of deeply incised, narrow valleys amongst the exposed granophyre bedrock, generally trending either south-west to north-east or west to east throughout the Burrup Peninsula.

Site D Boundary

Area of Disturbance 'The Site'

Geological Cross Section

Environmental Resources Management Australia Pty Ltd Adelaide, Brisbane, Canberra, Hunter Valley, Melbourne, Perth, Port Macquarie, Sydney

The proposed TANPF site is located on Pleistocene red-brown silty sand and silts and mud of the supratidal flats between King Bay and Hearson Cove. The area is associated with a large weathered dolerite dyke along the King Bay Hearson Cove lineament. As a result there is less outcrop of the exposed granophyre bedrock in this area than in other areas of the Peninsula. The large areas of exposed granophyre bedrock outcrops are generally located towards the southern and northern boundaries of Site D.

Supratidal flats run through the southern section of the site and indicate a soil profile associated with a low energy marine depositional environment. The soil profile is largely comprised of sandy silts to silty sands generally brown to grey in colour with occasional variations including green, yellow and red mottling. The sediments are typically organically rich and often contain a thin veneer of shelly lenses.

The soils of the area are generally alkaline (ERM 2011) as a result of the high carbonate content originating from marine sands and underlying calcrete bedrock.

3.5.2 Site Geological Observations

The geology encountered during drilling at the site is presented as borelogs in *Annex D*. The general geological profile observed during drilling is summarised as:

- Silty or clayey sand: red brown, fine to medium grained, sub angular sand, poorly sorted with gravel being more frequent in the northern area of the site and occasional cobbles being present, extending from between 0.5 m and 4.0 m, overlying;
- Granophyre: Pale grey, generally weathered with rock becoming fresher and less fractured with depth extending to the maximum depth of 5.0 m.

Golder (2011) noted that the granophyre bedrock consisted of pale grey and dark grey, fine to medium sized crystals, which was distinctly weathered and generally becoming fresher with depth. The bedrock was locally fractured along thin iron-stained quartz seams, generally of high to extremely high strength, extending to a maximum depth of 15 m. Golder also noted dolerite in one borehole location which was used for geotechnical purposes only (BH04).

Geotechnical investigations in the north-east portion of the site (temporary lay down area) suggest the presence of silty sands of colluvial origin to depths of up to 2.3 m (Golder, 2011). The 1:50,000 geology map also indicates the presence of marine mud and silt intertidal flat deposits in the southern area of the site. These superficial deposits are typically underlain by well jointed fresh granophyre bedrock (Golder, 2011). In the vicinity of tidal flats in the central and southern areas of the site, sandy clays are more dominant in the upper unconsolidated profile (ERM 2011).

Overall the geology encountered during the site investigation is considered to be consistent with the geology identified during the desktop study. The additional geotechnical investigation completed by Golder (2011) is also noted to be consistent with the ERM field observations.

3.6 HYDROGEOLOGY

3.6.1 Regional Hydrogeology

There is little readily accessible groundwater on the Burrup Peninsula. Like much of the Pilbara, groundwater is predominantly located in fractured rock aquifers where it is stored in the fractures, joints, bedding planes and cavities of the rock mass.

The Hydrogeological Atlas (DoW website) indicates that the upper aquifer in this region is the low permeability, unconfined Pilbara Fractured Rock Aquifer that occurs in fractured and weathered dolerite, gabbro and ultrabasic intrusions in the region. Groundwater recharge to this aquifer is directly related to rainfall events where water infiltrates the fractures of the surface rock or infiltrates from surface water flows. These fractured rock aquifers are localised systems with little regional flow (DEC, 2006).

Hyper-saline groundwater typically occurs beneath supratidal flats and is, therefore, considered likely to be present in the southern part of the site and to the south-west and east of the site. The aquifer in the low-lying coastal soils and supratidal flats is reportedly tidally influenced and the groundwater is saline (SKM, 2001). The shallow aquifer in this region is categorised as a Level 1 aquifer which indicates it is shallow and present within superficial deposits which are likely to be unconfined.

3.6.2 Site Hydrogeology

The Hydrogeological Atlas (DoW website) suggests that the site is located on top of fractured and weathered dolerite, gabbro and ultrabasic intrusions which would form the localised unconfined, low permeability aquifer system referred to as the Pilbara Fractured Rock Aquifer. These descriptions are consistent with the observed geology at the site.

Groundwater investigations undertaken near the site by Soil & Rock Engineering (1999) and HLA-Envirosciences (1999) indicated that groundwater is generally shallow and was typically at a depth of between approximately 3.4 and 0.5 metres below ground level. The groundwater level is anticipated to be higher during spring tides and following significant rainfall events.

3.6.3 Groundwater Elevations

Regional Groundwater Elevations

A number of geotechnical investigations have been undertaken at the ammonia facility located to the immediate west of the proposed site. These have included the installation of several groundwater monitoring wells. Water elevations for these wells were not presented in the reports reviewed and are currently unavailable (Soil and Rock Engineering, 2003a; Soil and Rock Engineering, 2003b). However, it is likely that, regionally, groundwater elevations mimic topography and are likely to be higher beneath outcropping bedrock in the north, and slope to the south before potentially discharging to the salt marsh and intratidal area or to King Bay to the west. Hearson Cove to the east is also a potential discharge point.

Site Groundwater Elevations

Groundwater elevations recorded on 29 April 2011, 20 September 2011 and 28 February 2012 are presented in *Annex E, Table 1* and interpolated groundwater elevation contour maps are provided as *Figure 3.12, 3.13 and 3.14*.

Recorded depths to groundwater at the site ranged from 0.54 to 3.4 metres below top of casing (mbTOC), (MW5 and MW1 in February 2012, respectively) and the groundwater elevations at the site ranged from 1.99 mAHD at MW5 in September 2011 to 6.46 mAHD at MW1 in April 2011.

The inferred groundwater flow direction was consistent, and to the southeast, during the three monitoring rounds at the Site. Groundwater elevations generally mimicked surface topography. The estimated hydraulic gradient in April 2011 was 0.011 across the site and was noted to be slightly steeper in the north-west section of the site. The hydraulic gradient in September 2011 was 0.0096 and in February 2012 was 0.009, indicating that although slightly lower, the hydraulic gradient was relatively consistent during the three groundwater monitoring events.

The groundwater elevation data indicates that, on the scale of monitoring, there was limited variation in groundwater elevations at the site; overall, groundwater elevations did not vary significantly in the April 2011, September 2011 and February 2012 monitoring rounds. However, these were point measurements and variations in groundwater elevations at the site are likely to have occurred between these two monitoring events.

The groundwater elevation in MW1 was observed to be 0.6 m higher during April 2011 compared to the September 2011 and February 2012 monitoring events. This decline in groundwater elevation was not observed in the other monitoring wells present on site over the same time period.

During the geotechnical assessment by Golder (2011), groundwater elevations were monitored in several geotechnical wells during late January and early

February 2011. The results for BH01, BH05 and BH07 (see *Figure 2.1*) all showed a strong response to the significant rainfall events associated with Cyclone Bianca, with groundwater levels increasing by up to 1.7 m in response to 117 mm of rainfall, which could indicate a low specific yield in a fractured rock system (Golder, 2011). A delayed response was observed in the water level in BH01, in the north-west of the site, potentially indicating a lower density of interconnected fractures, whereas a rapid response was observed in BH05 and BH07 indicating the likely presence of an interconnected fracture network. The interpretation provided by Golder is consistent with the borelogs which indicated greater average defect spacing in BH01 than BH05 and BH07 (Golder, 2011).

Golder (2011) also completed tidal monitoring between 20 January and 3 February 2011 (Golder, 2011) which indicated that the groundwater beneath the central and western portion of the site (in the vicinity of BH01, BH05 and BH07) is not tidally influenced. Data after 26 January 2011 was not assessed due to the likely influence of the significant rainfall event associated with Cyclone Bianca. The results were reportedly inconclusive with regard to neap tidal cycles, due to the short monitoring interval.

Aquifer Physical Parameters

Little desk-based information on the likely aquifer parameters in the region of the site is currently available; therefore site-specific data collected during the site investigation constitutes the principal means of evaluating hydrogeological parameters for the site.

Field Observations

During groundwater sampling (April 2011), MW1 – MW3 (see *Figure 2.1*) were all considered to have low to medium water level recovery rates, which appears consistent with the aquifer (Pilbara Fractured Rock Aquifer) in which the wells are screened. MW5 (see *Figure 2.1*) is screened in superficial Quaternary sediments and were observed to have good to moderate recovery rates during sampling. MW4 is screened across the basement rock and the overlying Quaternary sediments. The field observations are considered to be consistent with literature data for fractured rock aquifers and unconsolidated superficial sands, silts and clays.

Slug Testing Results

Slug tests were completed prior to conducting the groundwater monitoring event to assess the site-specific hydrogeological properties, however due to equipment failure and flooding at the site no results were obtained during the April 2011 visit.

Twenty nine slug tests were successfully completed at the five monitoring wells during the subsequent September 2011 and February 2012 visits. AqtesolvTM was used to complete the analysis of the slug test data. Several solution methods were used to assess the potential range of hydraulic conductivity values. Slugtest analyses and a table of the results are presented in *Annex H. Table 3.4* below provides a summary of these results.

¹ BR - Bouwer-Rice Solution

² H - Horslev Solution

Hydraulic Conductivity, K (m/day)

³ KGS - KGS Method (Hyder, et al. 1994)

The Bouwer-Rice (1976) and Hvorslev (1951) methods, which are straight line solutions, showed a reasonable comparison for the same data sets; however the Hvorslev solution which is for a confined aquifer generally resulted in higher estimated hydraulic conductivities. The Degan solution (straight line solution) was also used for comparative purposes and was found to provide similar results to the Bouwer-Rice and Hvorslev solutions. The KGS (1994) solution which is a curve matching solution also resulted in similar values to the straight line methods. Overall, the hydraulic conductivity values from the different methods were within a factor of 2 to 3, with the highest hydraulic conductivity values estimated from MW5 (5×10^{0} to 1×10^{1} m/d) in the supratidal flats, and the lowest values estimated from MW1 ($2 - 3 \times 10^{-1}$ m/d), located in bedrock, higher in the catchment .

Sensitivity Analysis

The sensitivity of the results was assessed by varying the estimated saturated thickness of the aquifer and the slope or curve of the match line. These results indicated that as the aquifer thickness was increased (in this instance a 5 m increase in aquifer thickness was used) the resultant hydraulic conductivity was slightly lower. Varying the slope or curve to incorporate later time data (after the water level had stopped oscillating in some wells such as MW4, February 2012) also lowered the estimated hydraulic conductivity values.

To assess the likely variation in hydraulic conductivity due to variation in the vertical and horizontal directions (anisotropy), the anisotropy ratios were varied for tests completed in MW5. MW5 is installed in Quaternary sediments; therefore the hydraulic conductivity in the horizontal direction is likely to be higher than in the vertical direction. Changing the anisotropy ratio to 0.1 for MW5 increased the hydraulic conductivity results by approximately 25%, for example from approximately 7.5 m/day to approximately 9.5 m/day.

Overall, the results of the sensitivity analyses were within the same range as the results of the primary analyses.

Comparison with Existing Data

Golder (2011) also completed slug tests at BH01, BH05 and BH07 (see *Figure 2.1*) as part of their geotechnical assessment. Higher hydraulic conductivities were measured in BH05 and BH07 (0.2 and 0.5 m/day respectively) which was considered by Golder to be consistent with the observed highly fractured zones within the granophyre. BH01 had a lower hydraulic conductivity (0.01-0.001 m/day) consistent with the field observations of the average defect spacing being above 100 mm (Golder, 2011).

The results for BH05 and BH07 (Golder, 2011) are considered to be consistent with the results from MW1 and MW3 which are also installed in the granophyre. The estimated hydraulic conductivity values from MW2 $(2-3x10^0 \text{ m/d})$ were higher than in the other granophyre wells; however, this is considered to reflect the natural variability of fracture occurrence and interconnectivity in the shallow fractured granophyre.

Summary

Overall the results indicated that the hydraulic conductivity value of the Quaternary sediments in the southern area of the site is likely to be higher (5-10 m/d) than in the fractured bedrock in the northern area of the site (0.001-3 m/d).

Slug tests, however, test only a small portion of the aquifer directly adjacent to the screened portion of the well, therefore conditions in other areas of the site may vary from the values presented here and in Golder (2011).

Literature Review

A review of relevant literature sources indicates that typically fractured rock aquifers have porosity ranges of between 5 and 50% (Kruseman & de Ridder, 1994) dependant on the frequency and width of the fractures. The hydraulic conductivity of fractured rock aquifers is typically reported as being between almost 0 and 1000 m/day, again dependant on the frequency, width, orientation and connectivity of the fractures. Specific yield in fractured rock aquifers is typically less than 0.05 (5%) due to most of the water being contained within fractures and the rock mass only having a very limited storage capacity.

The overlying superficial aquifer was observed to contain silts, sands and gravels in varying proportions and within various horizons. Unconsolidated aquifers typically have porosity values ranging between 10 and 50% depending on the proportions of finer grained materials. Hydraulic conductivity values typically range between 0.001 and 5 m/day, again dependant on the relative quantities and distribution of the fine grained materials.

3.6.4 Groundwater Discharge and Recharge

Groundwater flow rates can be determined by using a modified version of Darcy's Law such that:

$$V = (K * i)/n$$
 (Equation 1)

Where:

V = groundwater flow velocity (m/day).

K = hydraulic conductivity (m/day).

i = groundwater gradient parallel to groundwater flow (m/m).

 n_e = effective porosity (dimensionless).

Figure 3.15 Estimated Groundwater Flow Rates

	MWs 1, 2, 3	MW4 and MW5
Geological Unit	Granophyre	Quaternary Sediments
Hydraulic Gradient (m/m)	0.009	0.001^{1}
Estimated Minimum K ² (m/day)	0.001	2
Estimated Maximum K (m/day)	3	10
Assumed Effective Porosity (ne)	0.1	0.2
Estimated Velocity Range (m/day)	0.0001-0.3	0.01-0.05

¹ Assumed hydraulic gradient within supratidal flats

The estimated groundwater flow rate results vary over a significant range due to the observed heterogeneity within the geological formations at the Site and the variability in hydraulic gradient that is likely to apply in the granophyre bedrock and in the sediments of the supratidal flats.

Based on groundwater elevation data from the site, groundwater appears to be being recharged predominately from the bedrock that crops out to the north of the site. Rainwater that infiltrates the fracture system within the bedrock will then discharge into the supratidal flat and the salt marsh areas prior to discharging to King Bay to the west. It is possible that some groundwater may ultimately discharge to Hearson Cove; however, insufficient local data is available at present to assess the potential discharge areas.

3.6.5 Groundwater Use

The primary water supplies for this area include the:

- West Pilbara Water Supply Scheme, which obtains water from outside the local area from Harding Dam (surface water) and the Millstream Aquifer (groundwater); and
- Burrup seawater supply scheme and desalination plant, which provides seawater and desalinated water to industry on the Burrup Peninsula, with the water sourced from King Bay.

These water sources indicate that local groundwater is unlikely to be used in significant volumes.

The Hydrogeological Atlas (DoW website) does not indicate the presence of water supply wells within and around the proposed site. This may be due to a limitation of the hydrogeological atlas system within WA. As such it is not

² K - Hydraulic Conductivity

currently known if any water supply wells (of any type) are located within the vicinity of the site. However, given the scarcity of development in this area it is likely that any water wells are located some distance away from the site and are unlikely to be impacted by any temporary dewatering associated with plant construction.

3.6.6 Groundwater Quality

Regional Data

The Hydrogeological Atlas (DoW website) represents a regionally based characterisation of the groundwater quality and indicates that the groundwater salinities within this area are likely to range between 1,000 and 3,000 mg/L.

Groundwater yields and quality within this area are currently not well delineated; however, given the lithology of the area, they are expected to be low, consistent with field observations at the site. Although not assessed directly, the potential receiving water bodies for groundwater discharge in this area are considered to be the supratidal flats, King Bay, and potentially, Hearson Cove.

Analysis of potential contaminants indicates that no hydrocarbons or organic compounds were detected in groundwater from the area (HLA-Envirosciences, 1999). Concentrations of metals and sulphate, and pH values were measured prior to the construction of the BFPL plant, and were found to be within regulatory guidelines, with sulphates concentrations being marginally higher than normal background concentrations (HLA-Envirosciences, 1999).

Total dissolved solids (TDS) concentrations in groundwater from the supratidal flats were about 77,000 mS/cm (HLA-Envirosciences, 1999) which is greater than the TDS concentration for seawater (40,000 - 50,000 mS/cm). This is typical of supratidal environments which are subject to greater evaporation rates.

Site Data

The field parameters measured during the groundwater sampling completed in late April 2011, September 2011 and February 2012 are presented in *Annex E, Table 2* and are summarised as follows:

 pH values were generally neutral in groundwater from all wells sampled, and ranged between 6.55 and 7.64. This was within the range of acceptable values specified in the ANZECC, 2000 drinking water guidelines;

- electrical conductivity (EC) values ranged between 2,510 μ S/cm (MW1) and 16,000 μ S/cm (MW3), however it is considered likely that the EC probe exceeded the measurable maximum concentration at MW5;
- dissolved oxygen (DO) values ranged between 1.8 mg/L (MW5) and 4.7 mg/L (MW1). This range is considered to be typical of groundwater, which generally has lower values than surface water;
- temperature ranged between 27 and 32.6 °C; and
- redox potential (Eh) ranged between -100 mV, which is indicative of reducing conditions and 289 mV, which is indicative of oxidising conditions.

Although the measured field parameters varied slightly between monitoring rounds, seasonal variation does not appear to have a significant effect on the groundwater quality at the Site.

The groundwater sampling analytical results are presented in *Annex E* and Tables 3, 4 and 5; *Annex F* presents the laboratory reports. While there is no requirement to screen groundwater results for this baseline study, a summary is provided below comparing results against guidelines to provide an indication of groundwater quality. General observations are as follows:

- chromium (hexavalent) (MW5, 0.01 mg/L, April 2011) was measured in groundwater at a concentration above the threshold criterion (0.0044 mg/L). Analysis for chromium (hexavalent) was not completed during the September 2011 and February 2012 monitoring rounds;
- zinc was present in groundwater from MW1 and MW3 at concentrations above the threshold criteria of 0.015 mg/L (protective of 95% of marine water species, WA DEC 2010) in all three sampling rounds. Groundwater from MW2 and MW4 also contained zinc at concentrations above the criterion in the September 2011 and February 2012 monitoring rounds;
- sulphate was present in groundwater at concentrations (MW3, maximum 940 mg/L and MW5 maximum 5,200 mg/L) exceeding the Australian drinking water guidelines (500 mg/L) (NHMRC, 2004);
- chloride was present in groundwater from some wells at concentrations (MW3, maximum 5,400 mg/L, MW4, maximum 3,900 mg/L and MW5, maximum 87,000 mg/L) exceeding the DoH 2006 domestic non-potable groundwater guidelines (2,500 mg/L);
- nitrate as NO₃- was present in at concentrations that exceeded the ANZECC 2000 95% guideline (0.7 mg/L as NO3) in groundwater from all five monitoring wells during the February 2012 monitoring event (MW1, maximum 8.7 mg/L). Nitrate was not measured during the first two monitoring rounds;

- total recoverable hydrocarbon (TRH) (C_{10} - C_{14}) was measured in groundwater from MW5 at 81 $\mu g/L$, however no guideline value is available as a comparison;
- all other analytes measured either had no threshold criteria or were below the relevant guidelines; and
- dissolved major cations and anions concentrations varied across the site, with combined totals ranging from 2,000 mg/L in groundwater from MW1 to 130,000 mg/L in groundwater from MW5. These combined totals are indicative of total dissolved solids concentrations and indicate that the groundwater is not of potable water quality. The elevated concentrations in groundwater from MW5 are consistent with evaporation / evapotranspiration in the supratidal flat environment.

Overall, the field chemical parameters and analytical results indicate that the water quality is not suitable for drinking water purposes due to the high salt content.

Vegetation identified during the 2009 survey is considered to be consistent with the groundwater geochemistry noted during this investigation; salt tolerant species were identified in the south-eastern areas of the site which are supratidal flats characterised by high groundwater and soil salinity.

Piper plots presented in *Annex G* indicate that the water quality varies between MW1 and MW2, which are located on the up hydraulic gradient side of the site, and MW3, MW4 and MW5 which are located further down hydraulic gradient; however, in all samples, the groundwater remains dominated by sodium and chloride. The three data sets from April 2011, September 2011 and April 2012 show good correlation with all three showing variation in groundwater chemistry dependant on the monitoring wells locations. This observed variation in geochemistry is consistent the presence of the supratidal flats in the south of the site. Seawater inundation and groundwater discharge by evaporation and evapotranspiration in the supratidal flat area would concentrate chloride in groundwater in the south of the site, while groundwater in the northern area is recharged by precipitation and therefore has lower salinities and higher HCO₃/Cl ratios. This variation in geochemistry does not indicate the presence of two distinct and unconnected aquifer systems as the water table intersects the different hydrogeological settings.

3.7 DEWATERING

ERM understands that cut and fill earthworks will be required at the site to level the site to approximately 5.5 mAHD. Following review of the groundwater levels measured in January 2011 during well installation works, April 2011, September 2011 and February 2012, the requirement for

dewatering is likely to be dependent on the frequency and volume of rainfall prior to and during ground works and construction.

Golder (2011) report that based on their geotechnical investigation minimal to no active dewatering should generally be required during construction, other than after cyclonic rainfall events when groundwater elevations may rise above the base of excavation which is understood to be 2.5 m AHD (Golder, 2011). The time period for groundwater to return to pre-cyclone levels is unknown, however groundwater levels observed in April 2011 were noted to be generally elevated when compared to January 2011 data. It should be noted, however, that no direct comparison can be made between groundwater elevations from BH01, BH05, BH07 and MW1-MW5 as the data were collected at different times.

4 POTENTIAL IMPACTS & MANAGEMENT MEASURES

Based on the hydrological and hydrogeological investigations, the key potential impacts associated with the development are discussed below.

4.1 SITE LEVELS AND FLOODING

Flooding is a potential risk to the development and warrants careful consideration. The modelling undertaken by Golder (2001) predicts a maximum water surface level of 5.6 mAHD for storm events with recurrence intervals ranging from 10 to 100 years. However, this value may be an overestimate. The KSSIS (BoM, 1996) predicts maximum water surface levels in the vicinity of the site of 5.0 mAHD based on a 100-year return interval. Based on the information available, ERM considers that this is a more reliable estimate.

The final site level proposed for the TANPF is 5.5 mAHD and, as such, is located above the 100 year ARI storm surge level predicted in the KSSIS (BoM, 1996).

Filling of the site for construction of the TANPF will reduce the flood storage capacity of the supratidal flats to the south. This could affect flood levels both onsite and in adjacent areas during flood events, and may be particularly pronounced during extreme rain events and high catchment runoff. Increasing the level of the site could help prevent impacts associated with this, though further investigations would be required (see *Section 4.2*).

4.2 STORMWATER DIVERSION CONSIDERATIONS

The proposed TANPF site can experience significant stormwater run-on from the north. This is likely to comprise a combination of sheet flow as well as concentrated flow within defined drainage lines. There are at least three prominent intermittent watercourses (gullies) that intersect the site's northern boundary.

Suitable diversion works should be constructed to collect and convey upslope clean stormwater around and/or through the development site and to the low lying supratidal flats in the south. This is necessary to minimise the risk of inundation and stormwater damage to infrastructure, and will also be important for water quality control both during construction and when the TANPF site is operational. Preventing mixing of clean and potentially contaminated stormwater at the TANPF site will be an important component of the water management plan.

A possible solution to managing stormwater is construction of a drain along the northern side of the development, close to the property boundary, that captures and drains upslope stormwater to the east and around the development site. Similar drains may be required to convey stormwater around the western and eastern boundaries.

These drains should be designed to convey stormwater flows and remain stable (i.e. erosion resistant) in flows up to the 100-year ARI storm event. Golder (2011) have undertaken preliminary sizing of the perimeter drains; however, detailed design will be required, which includes the design of channel stabilisation, selecting the preferred location and alignment based on local topography, and design of outlet structures.

Consideration should also be given to the impact of the proposed development on the flood conveyance capacity of the supratidal flats, which the proposed development is currently planned to partially fill. It may be necessary to construct additional waterway capacity to manage local catchment peak flows as well as to prevent an unacceptable increase in flooding hazard both at the subject site and on surrounding lands. HEC-RAS modelling has been undertaken by Golder (2011) although the implications of this modelling require further consideration. It is recommended that the modelling be extended to assess the relative increase in flood magnitude, frequency and flow velocities caused by filling the floodplain. This should be undertaken in isolation of storm surge influences to gain a true picture of impacts on local catchment drainage. Issues to be considered should include:

- impacts on surrounding land, ecosystems and developments (both existing developments and any proposed or foreseen developments within the area);
- assessment of compliance with relevant legislation and flood planning controls;
- impacts on groundwater conditions (quality and levels) and soil salinity; and
- review of mitigation options to reduce any identified impacts.

5.1 HYDROLOGICAL ASSESSMENT

A desktop assessment and field investigation were completed to develop a preliminary conceptual understanding of the hydrology and hydrogeology of the site so that key potential impacts of the proposed TANPF development on surrounding groundwater and surface water features could be identified.

With respect to surface waters, the proposed TANPF intersects a number of ephemeral watercourses which drain the slopes to the north. Diversion of these flows will be required. A suitable option would be construction of diversion drains along the northern, western and eastern perimeters of the site. Peak flows for the affected catchments have been calculated for rain events with recurrence intervals ranging from two to 50 years, and should be used to design any new diversion structures.

Flood modelling undertaken by Golder (2011) indicates that water levels would rise to approximately 5.6 m AHD due to storm surge in a 100 year return interval event. This exceeds the proposed site level of 5.5 m AHD suggesting that some parts of the site could be inundated in such an event. However, ERM's review of the Golder (2011) modelling suggests the data may be unreliable, with the maximum storm surge height used by Golder (2011) not being well explained or justified. In particular, questions are raised relating to the designated downstream water level (5.6 m AHD). ERM believes this value may overestimate the potential storm surge levels. It is recommended that the client discuss these issues with Golder and if necessary, the modelling should be revised.

ERM has estimated 24-hour detention requirements for site-generated stormwater, for both clean and dirty stormwater catchments, for one to 100 year ARI storm events. For the clean water catchment with an estimated area of 2.1 hectares, the 24-hour detention volumes are approximately 6.8 ML for a 50-year ARI event and 8.3 ML for a 100-year ARI event. For the dirty water catchment with an estimated area of 0.6 hectares, the 24-hour detention volumes are approximately 1.9 ML for a 50-year ARI event and 2.4 ML for a 100-year ARI event. The proposed ponds should be of sufficient capacity to accommodate the predicted volumes generated, if managed appropriately.

5.1.1 *Uncertainties - Hydrology*

Several uncertainties still exist with respect to the potential flood risk, requirements for stormwater detention and the interactions between surface and groundwater at the site. As indicated above, ERM has identified the use of the 5.6 mAHD storm surge and maximum tide water level by Golders in the flood modelling may be over-estimating the likely peak flood levels.

Consultation with Golder is recommended to address this issue and if necessary, the modelling should be revised.

The modelling undertaken to date does not appear to assess potential impacts associated with filling of the floodplain to allow for the construction of the site. A review of the HEC-RAS model developed by Golder should be undertaken to quantify this issue. If the impacts are significant, the following flood mitigation measures may need to be developed:

- flood planning for existing and proposed developments;
- infrastructure designed with consideration to flood levels;
- structures such as retention basins and/or floodways; and
- creating additional waterway capacity.

Short term (24-hour) runoff volumes from the developed site have been calculated; however, further liaison with relevant government agencies would be required to determine detention requirements for compliance with industry best practice guidelines and any conditions of consent. Detention requirements may be greater for dirty water than clean water catchments, due to the increased pollution risks and the greater detention times required to achieve effective water treatment and any discharge targets.

Golder (2011) indicated that the estimated flood velocities were likely to be low and erosion would likely be negligible, however the use of rip-rap for erosion control and improved stability along the southern side of the TANPF was still recommended. This is considered to be an uncertainty by ERM and further discussions are warranted following release of design criteria for the stormwater management system.

Detailed design of the stormwater management system is still to be undertaken. It is expected that this would address, among other things:

- stormwater treatment measures to prevent adverse impacts on the quality of receiving waters (groundwater and surface water);
- use of stormwater detention structures to minimise the potential increase in site stormwater peak flows bought about by the increase in impervious surfaces and installation of hydraulically efficient stormwater drainage infrastructure;
- opportunities for stormwater capture and reuse; and
- design of and specification of discharge limits for any stormwater discharge locations, including design of outlet structures that minimise potential for offsite impacts such as flooding and erosion.

5.2 HYDROGEOLOGICAL ASSESSMENT

The average groundwater elevations across the site were 3.6 mAHD in late April 2011, and 3.4 mAHD in September 2011 and February 2012. The inferred groundwater flow direction was to the south-easterly direction across the portion of the site proposed to be developed during all three monitoring events. The hydraulic gradient was noted to be slightly steeper in the northwest than in the south of the site and groundwater elevation was generally noted to mimic surface topography.

Groundwater elevations observed in April 2011 had risen significantly from those observed during installation of the monitoring wells and the geotechnical assessment reported that groundwater elevation showed a strong response to the significant rainfall events associated with Cyclone Bianca. A significant decrease in groundwater elevation (from 6.46 to 5.86 mAHD in MW1) in the north-western area of the site was observed between the April 2011 and the September 2011 monitoring events.

Tidal monitoring completed as part of the geotechnical assessment indicated that groundwater in bedrock beneath the central and western portion of the site is unlikely to be tidally influenced.

Geochemical parameters indicate that the water quality is variable across the site, predominantly resulting from groundwater recharge on the hills where the granophyre crops out and from groundwater discharge due to evaporation and evapotranspiration in the supratidal flats in the south of the site. Based on the groundwater elevation and chemistry assessment it is considered likely that groundwater in the granophyre and the supratidal flats is connected, with the water table intersecting the different hydrogeological settings.

Vegetation identified during the 2009 survey is considered to be consistent with the groundwater geochemical results recorded during this investigation; salt tolerate species were identified in the south-eastern areas of the site which are considered to be supratidal flats with high soil and groundwater salinity levels.

5.2.1 *Uncertainties - Hydrogeology/Groundwater*

Several uncertainties still exist with respect to the condition and presence of groundwater at the site.

Although groundwater was observed during the monitoring period in April 2011 to be below the anticipated depth of excavation for the TANPF, it is also noted that during and following Cyclone Bianca significant groundwater elevation rises were observed; however the monitoring frequency over that period was insufficient to establish the maximum groundwater elevations that occurred in response to the cyclone. The duration of monitoring after the cyclone has also been insufficient to assess whether groundwater elevations have decreased compared to pre-cyclone conditions. Further information is

required to assess the persistence of elevated groundwater levels to assist with determining the need for dewatering at the site during construction.

Uncertainties are also present with respect to the available tidal monitoring data. The duration of the test period is considered insufficient to draw conclusions with respect to the influence of neap or spring tides at the site and the effect this may have on groundwater elevations in the supratidal flats at the site.

Although dewatering is not at this time considered likely at the site, should this change in future, further information on the likely effects of dewatering and saline intrusion will be required. The potential impact of discharge of groundwater from dewatering on the local groundwater quality is also unknown at this time.

Requirements for the assessment and management of groundwater at the site were formally conditioned in Ministerial Statement No. 870 published on 7 July 2011. Condition 8 of the ministerial approval indicates that detailed hydrogeological studies shall be commenced at least 12 months prior to the commencement of construction to quantify groundwater quality, groundwater flow directions, and the depth to groundwater beneath the TANPF site and in surrounding areas. It is considered that the preliminary data collected at the site is sufficient to discharge Condition 8-1, however that uncertainties with regard to dewatering requirements remain.

6 RECOMMENDATIONS

Based on the preliminary assessments completed and the uncertainties presented above, the following recommendations are made for further hydrological and hydrogeological assessment:

- Further detailed design is required of upslope clean water diversion drains;
- Review flood modelling to address uncertainties with respect to assumed downstream water levels;
- Conduct additional flood modelling to assess the relative increase in flood magnitude, frequency and flow velocities caused by filling the floodplain.
 Related issues to be addressed include:
 - assess impacts on surrounding land, ecosystems and developments (both existing developments and any proposed or foreseen developments within the area);
 - assess impacts on groundwater conditions (quality and levels) and soil salinity;
 - assess compliance with relevant legislation and flood planning controls;
 and
 - review of mitigation options to reduce potential impacts.
- Determine onsite stormwater detention requirements for clean and dirty water catchments based on final site design and development conditions;
- Prepare stormwater management plans that address the management of clean and dirty stormwater, including any discharge procedures and water quality targets;
- If dewatering is to be considered for the site, pumping tests and assessment of groundwater elevation and quality in nearby observation bores should be conducted; and
- As part of detailed design, develop management plans for control of potential sources of on-site contamination. Such sources might include water, chemical and fuel storage facilities, waste water treatment facilities, and water and waste discharge processes.

Peak Flow Calculations

Rational Method calculations

 $Qy = 0.278 \times C_2 \times (C_Y/C_2) \times I_{Y, tc} \times A$ (from AR&R)

where: Q_v is peak flow rate (m³/sec) of average recurrence interval (ARI) of "Y" years

A is the catchment area in km²

I_{Y, tc} is the average rainfall intensity (mm/hr) for an ARI of "Y" years

and a design duration of "tc" (minutes or hours)

Time of concentration (t_c) = 0.56 x A^{0.38} hrs (from AR&R)

C_Y runoff coefficient for ARI of Y years

 $C_2 = 3.07 \times 10^{-1} \times L^{-0.2}$

L is the mainstream length (km) measured from the catchment outlet to the most remote point on the catchment boundary

 $F_Y = C_Y/C_2$ (frequency factor)

Rainfall intensities

Monitoring Well	Date	Elecctrical Conductivity (uS/cm)	TDS (mg/L) Calculated)	Dissolved Oxygen (mg/L)	pН	Redox (mV)	Temp (oC)	Sample Comments
MW1	29/04/2011	3,100	2,000*	2.43	6.95	-74	31.51	Slightly turbid, no odour, very pale brown
MW1	20/09/2011	2,510	1600	3.3	6.86	146	28.9	Becoming slightly turbid/white at 27 litres
MW1	28/02/2012	2,750	1800	4.67	6.9	153	30.13	Becoming pale brown, slow recharge, dry purched at 33L
MW2	29/04/2011	3,540	2,000*	2.74	7.16	57	31.98	Turbid, pale brown, no odour, moderate recharge, good yield
MW2	20/09/2011	4,160	2400	2.93	6.78	125	29.23	Good yield
MW2	28/02/2012	4,450	2500	2.4	6.83	149	31.52	Clear, colourless, no odour, becomes slightly turbid, pale grey, good recharge
MW3	29/04/2011	16,000	9,800*	2.8	7.3	-100	30.6	Pungent odour (fishy), slightly turbid, grey becoming pale brown, moderate recharge, good yield
MW3	20/09/2011	11,200	6900	2.37	7.22	50	27.18	Good yield
MW3	28/02/2012	13,640	8400	2.68	7.18	83	30.3	Clear, colourless, no odour, becoming slightly turbid, pale brown, good recharge
MW4	29/04/2011	12,160	6,700*	2.23	7.64	125	30.59	Highly turbid, silty, orange, no odour, good recharge/ yield
MW4	21/09/2011	7,660	4200	4.4	7.58	104	27.00	Good yield
MW4	28/02/2012	10,610	5800	2.48	7.5	79	31.8	Clear, colourless, becoming turbid, red-brown. No odour. Becoming very turbid
MW5	29/04/2011	10,000**	130000*	2.12	6.73	237	31.62	Orange, turbid, no odour, moderate recharge
MW5	21/09/2011	10,000**	-	3.82	6.55	270	28.00	Slightly turbid, lightly brown in colour
MW5	28/02/2012	10,000**	-	1.86	6.62	289	32.58	Clear, colourless, becoming turbid, pale brown, no odour.

Note:

^{* -} Laboratory TDS (mg/L)

^{** -} Considered to be erroneous data points based on major ion data. It is likely that the maximum measurable concentration of the probe was exceeded.

SGS Reference Report Number

0000019717 17 May 2011 Date Reported

02 May 2011 Date Received

COMMENTS

The document is issued in accordance with NATA's accreditation requirements.

Accredited for compliance with ISO/IEC 17025. NATA accredited laboratory 2562(898/20210).

Samples `MW3', `MW4' and `MW5' were diluted due to high conductivity for metals. Hence the LORs were raised for these samples.

Samples received outside recommended technical holding times for Alkalinity and Hexavalent Chromium.

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

METHOD SUMMARY

METHOD	METHODOLOGY OF MARKET
AN020	METHODOLOGY SUMMARY Unpreserved water sample is filtered through a 0.45μm membrane filter and acidified with nitric acid similar to APHA3030B.
AN075	This method uses an alkaline digestion to solubilise both water-soluble and waterinsoluble forms of hexavalent chromium in solids. The solution is then pH adjusted and the hexavalent chromium concentration in solution determined colourimetrically. Please refer to method AN283. The addition of magnesium chloride in a phosphate buffer at the digestion stage assists with preventing oxidation of trivalent chromium to hexavalent chromium.
AN083	Separatory funnels are used for aqueous samples and extracted by transferring an appropriate volume (mass) of liquid into a separatory funnel and adding 3 serial aliquots of dichloromethane. Samples receive a single extraction at pH 7 to recover base / neutral analytes and two extractions at pH < 2 to recover acidic analytes. QC samples are prepared by spiking organic free water with target analytes and extracting as per samples.
AN113	Total Dissolved Solids: A well-mixed filtered sample of known volume is evaporated to dryness at 180°C and the residue weighed. Approximate methods for correlating chemical analysis with dissolved solids are available. Reference APHA 2540 C.
AN121	This method is used to calculation the balance of major Anions and Cations in water samples and converts major ion concentration to milliequivalents and then summed. Anions sum and Cation sum is calculated as a difference and expressed as a percentage.
AN135	Alkalinity (and forms of) by Titration: The sample is titrated with standard acid to pH 8.3 (P titre) and pH 4.5 (T titre) and permanent and/or total alkalinity calculated. The results are expressed as equivalents of calcium carbonate or recalculated as bicarbonate, carbonate and hydroxide. Reference APHA 2320. Internal Reference AN135
AN149	Sulphide by Iodometric Titration: Sulphide is precipitated as zinc sulphide to overcome interferences with sulphite and thiosulphate. After filtration, sulphide is determined titrimetrically. Reference APHA 4500-S2-
AN258	Nitrate and Nitrite by FIA: In an acidic medium, nitrate is reduced quantitatively to nitrite by cadmium metal. This nitrite plus any original nitrite is determined as an intense red-pink azo dye at 540 nm following diazotisation with sulphanilamide and subsequent coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. Without the cadmium reduction only the original nitrite is determined. Reference APHA 4500-NO3- F.
AN261	Ammonia by Continuous Flow Analyser: Ammonium in a basic medium forms ammonia gas, which is separated from the sample matrix by diffusion through a polypropylene membrane. The ammonia is reacted with phenol and hypochlorite to form indophenol blue at an intensity proportional to the ammonia concentration. The blue colour is intensified with sodium nitroprusside and the absorbance measured at 630 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-NH3 H.
AN274	Chloride by Aquakem DA: Chloride reacts with mercuric thiocyanate forming a mercuric chloride complex. In the presence of ferric iron, highly coloured ferric thiocyanate is formed which is proportional to the chloride concentration. Reference APHA 4500CI-
AN275	Suphate by Aquakem DA: Sulphate is precipitated in an acidic medium with barium chloride. The resulting turbidity is measured photometrically at 405nm and compared with standard calibration solutions to determine the sulphate concentration in the sample. Reference APHA 4500-SO42 Internal reference AN275.
AN278	Reactive Phosphorus by Aquakem DA: Orthophosphate reacts with ammonium molybdate (Mo VI) and potassium antimonyl tartrate (Sb III) in acid medium to form an antimony-phosphomolybdate complex. This complex is subsequently reduced with ascorbic acid to form a blue colour and the absorbance is read at 880 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-P F
AN279/AN293	The sample is digested with Sulphuric acid, K2SO4 and CuSO4. All forms of phosphorus are converted into orthophosphate. The digest is cooled and placed on the Aquakem 250 discrete analyser for colorimetric analysis.

Page 8 of 10 17-May-2011

METHOD SUMMARY

METHOD	METHODOLOGY SUMMARY
AN283	Hexavalent Chromium via Aquakem DA: Soluble hexavalent chromium forms a red/violet colour with diphenylcarbazide in acidic solution. This procedure is very sensitive and nearly specific for Cr6+. If total chromium is also measured the trivalent form of chromium Cr3+ can be calculated from the difference (Total Cr - Cr6+). Reference APHA3500CrB.
AN288	Digestion of the sample to convert amino nitrogen present in many organic materials to ammonium sulphate. Free ammonia and ammonium nitrogen also are converted to ammonium sulphate. Colorimetric determination of ammonium nitrogen using the Phenate-Hypochlorite Method (APHA, 2005). Ammonia, phenol and hypochlorite react in an alkaline buffered medium to form a blue coloured compound, indophenol. This reaction is catalysed by sodium nitroprusside. The intensity of the colour development is directly proportional to the concentration of ammonia-nitrogen.
AN311/AN312	Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500.
AN318	Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A.
AN320/AN321	Metals by ICP-OES: Samples are preserved with 10% nitric acid for a wide range of metals and some non-metals. This solution is measured by Inductively Coupled Plasma. Solutions are aspirated into an argon plasma at 8000-10000K and emit characteristic energy or light as a result of electron transitions through unique energy levels. The emitted light is focused onto a diffraction grating where it is separated into components.
AN320/AN321	Photomultipliers or CCDs are used to measure the light intensity at specific wavelengths. This intensity is directly proportional to concentration. Corrections are required to compensate for spectral overlap between elements. Reference APHA 3120 B.
AN403	Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36.
AN403	Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Petroleum Hydrocarbons (TPH) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with diffential polarity of the elluent solvents.
AN403	The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependant on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.
AN433/AN434	VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

Address

All the laboratory data for each environmental matrix was compared to the SGS Environmental Services' stated data quality objectives (DQO).

Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the chain of custody document and was supplied by the client.

This QA/QC statement must be read in conjunction with the referenced analytical report.

The statement and the analytical report must not be reproduced except in full.

All Data Quality Objectives were met with the exception of the following:

Extraction Date 6 Items

> Hexavalent Chromium in water by Discrete Analyser 8 Items

Analysis Date Alkalinity 6 Items

> Hexavalent Chromium in water by Discrete Analyser 8 Items

MS Trace Metals (Dissolved) in Water by ICPMS 1 Item

HOLDING TIME SUMMARY

HOLDING TIMES

DUP01

RIN 1

Trip Blank

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If

Samples received outside recommended technical holding times for Alkalinity and Hexavalent Chromium.

17/05/2011 Page 4 of 18

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Sample Name

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

LABORATORY CONTROL STANDARDS

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report.

Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

QUALITY CONTROL - MATRIX SPIKES

Matrix spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report. Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).

17/05/2011 Page 17 of 18

MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as relative percent difference using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean The original result is the analyte concentration of the matrix spike and the replicate result is the analyte concentration of the matrix spike duplicate. The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability RPD is shown in Green when within suggested criteria or **Bold** with an appended dagger symbol and **Red†** when outside suggested criteria.

No Matrix Spike Duplicates were required for this job.

FOOTNOTES -

IS Insufficient sample for analysis. LNR Sample listed, but not received.

NATA Accreditation does not cover this analysis.

^ Performed by outside laboratory.

LOR Limit of Reporting

Samples analysed as received.
Solid samples expressed on a dry weight basis.

QFH QC result is above the upper tolerance
QFL QC result is below the lower tolerance
NA The sample was not analysed for this analyte

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

SGS Reference Report Number

PE060993 R0 0000027829 03 Oct 2011

Date Reported Date Received

22 Sep 2011

COMMENTS

The document is issued in accordance with NATA's accreditation requirements. Accredited for compliance with ISO/IEC 17025. NATA accredited laboratory 2562(898/20210).

Samples diluted for Trace Metals; hence the LOR's were raised.

Spike recovery for Total AI and Fe on sample "MW1" outside acceptance criteria due to matrix interference. Confirmed by re-analysis.

Chloride and sulphate spike recoveries were outside acceptance criteria due to high background.

Ion Balance for sample "RIN01" outside acceptance criteria due to low Conductivity.

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

SGS

METHOD SUMMARY

METHOD	METHODOLOGY SUMMARY —
AN020	Unpreserved water sample is filtered through a 0.45µm membrane filter and acidified with nitric acid similar to APHA3030B.
AN022	Sample is prepared for metals analysis by digestion with Nitric Acid and made up to known volume.
AN022/AN320/AN321	Total (acid soluble) Metals by ICP-OES: Samples are digested in nitric or nitric and hydrochloric acids prior to analysis for a wide range of metals and some non-metals. This solution is measured by Inductively Coupled Plasma. Solutions are aspirated into an argon plasma at 8000-10000K and emit characteristic energy or light as a result of electron transitions through unique energy levels. The emitted light is focused onto a diffraction grating where it is separated into components.
AN114	Total Suspended and Volatile Suspended Solids: The sample is homogenised by shaking and a known volume is filtered through a pre-weighed GF/C filter paper and washed well with deionised water. The filter paper is dried and reweighed. The TSS is the residue retained by the filter per unit volume of sample. Reference APHA 2540 D. Internal Reference AN114
AN121	This method is used to calculation the balance of major Anions and Cations in water samples and converts major ion concentration to milliequivalents and then summed. Anions sum and Cation sum is calculated as a difference and expressed as a percentage.
AN135	Alkalinity (and forms of) by Titration: The sample is titrated with standard acid to pH 8.3 (P titre) and pH 4.5 (T titre) and permanent and/or total alkalinity calculated. The results are expressed as equivalents of calcium carbonate or recalculated as bicarbonate, carbonate and hydroxide. Reference APHA 2320. Internal Reference AN135
AN140	Acidity by Tritration: The water sample is titrated with sodium hydroxide to designated pH end point. In a sample containing only carbon dioxide, bicarbonates and carbonates, titration to pH 8.3 at 25°C corresponds to stoichiometric neutralisation of carbonic acid to bicarbonate. Method reference APHA 2310 B.
AN141	Determination of Fluoride by ISE: A fluoride ion selective electrode and reference electrode combination, in the presence of a pH/complexation buffer, is used to determine the fluoride concentration. The electrode millivolt response is measured logarithmically against fluoride concentration. Reference APHA F- C.
AN149	Sulphide by lodometric Titration: Sulphide is precipitated as zinc sulphide to overcome interferences with sulphite and thiosulphate. After filtration, sulphide is determined titrimetrically. Reference APHA 4500-S2-
AN258	Nitrate and Nitrite by FIA: In an acidic medium, nitrate is reduced quantitatively to nitrite by cadmium metal. This nitrite plus any original nitrite is determined as an intense red-pink azo dye at 540 nm following diazotisation with sulphanilamide and subsequent coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. Without the cadmium reduction only the original nitrite is determined. Reference APHA 4500-NO3- F.
AN261	Ammonia by Continuous Flow Analyser: Ammonium in a basic medium forms ammonia gas, which is separated from the sample matrix by diffusion through a polypropylene membrane. The ammonia is reacted with phenol and hypochlorite to form indophenol blue at an intensity proportional to the ammonia concentration. The blue colour is intensified with sodium nitroprusside and the absorbance measured at 630 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-NH3 H.
AN274	Chloride by Aquakem DA: Chloride reacts with mercuric thiocyanate forming a mercuric chloride complex. In the presence of ferric iron, highly coloured ferric thiocyanate is formed which is proportional to the chloride concentration. Reference APHA 4500CI-
AN275	Suphate by Aquakem DA: Sulphate is precipitated in an acidic medium with barium chloride. The resulting turbidity is measured photometrically at 405nm and compared with standard calibration solutions to determine the sulphate concentration in the sample. Reference APHA 4500-SO42 Internal reference AN275.

Page 9 of 11 03-October-2011

METHOD SUMMARY

METHOD	
METHOD -	METHODOLOGY SUMMARY
AN278	Reactive Phosphorus by Aquakem DA: Orthophosphate reacts with ammonium molybdate (Mo VI) and potassium antimonyl tartrate (Sb III) in acid medium to form an antimony-phosphomolybdate complex. This complex is subsequently reduced with ascorbic acid to form a blue colour and the absorbance is read at 880 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-P F
AN279/AN293	The sample is digested with Sulphuric acid, K2SO4 and CuSO4. All forms of phosphorus are converted into orthophosphate. The digest is cooled and placed on the Aquakem 250 discrete analyser for colorimetric analysis.
AN281	Digestion of the sample to convert amino nitrogen present in many organic materials to ammonium sulphate. Free ammonia and ammonium nitrogen also are converted to ammonium sulphate. Colorimetric determination of ammonium nitrogen using the Phenate-Hypochlorite Method (APHA, 2005). Ammonia, phenol and hypochlorite react in an alkaline buffered medium to form a blue coloured compound, indophenol. This reaction is catalysed by sodium nitroprusside. The intensity of the colour development is directly proportional to the concentration of ammonia-nitrogen.
AN318	Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A.
AN320/AN321	Metals by ICP-OES: Samples are preserved with 10% nitric acid for a wide range of metals and some non-metals. This solution is measured by Inductively Coupled Plasma. Solutions are aspirated into an argon plasma at 8000-10000K and emit characteristic energy or light as a result of electron transitions through unique energy levels. The emitted light is focused onto a diffraction grating where it is separated into components.
AN320/AN321	Photomultipliers or CCDs are used to measure the light intensity at specific wavelengths. This intensity is directly proportional to concentration. Corrections are required to compensate for spectral overlap between elements. Reference APHA 3120 B.
AN433/AN434	VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

EOOTNOTES

IS Insufficient sample for analysis.

LNR Sample listed, but not received.

This analysis is not covered by the scope of accreditation.

Performed by outside laboratory.

LOR Limit of Reporting

All Raised or Lowered Limit of Reporting

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QFH QC result is above the upper tolerance
QFL QC result is below the lower tolerance
The sample was not analysed for this analyte

NVL Not Validated

Some totals may not appear to add up because the total is rounded after adding up the raw values.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

COMMENTS

All the laboratory data for each environmental matrix was compared to the SGS Environmental Services' stated data quality objectives (DQO).

Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the chain of custody document and was supplied by the client.

This QA/QC statement must be read in conjunction with the referenced analytical report.

The statement and the analytical report must not be reproduced except in full.

All Data Quality Objectives were met with the exception of the following:

Extraction Date Acidity and Free CO2 3 Items

Alkalinity 3 Items

Analysis Date Acidity and Free CO2 3 Items

Alkalinity 3 Items

MS Metals in Water (Total) by ICPOES 2 Items

Sulphate in water 1 Item

HOLDING TIME SUMMARY

HOLDING TIMES .

DUP01

PE060993.006

LB027870

21 Sep 2011

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in **Bold** with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

HOLDING TIMES

MW5

DUP01

PE060993.005

PE060993.006

LB027803

LB027803

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1 : 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

HOLDING TIMES -

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in **Bold** with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

Samples "MW1", "MW2" and "MW3" receive outside recommeded technical holding time for Alkalinity and Acidity analysis.

3/10/2011 Page 4 of 19

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions,

surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

Alkalinity Method: ME-(AU)-[ENV]AN135

LB027789.060

Total Alkalinity as CaCO3

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

LABORATORY CONTROL STANDARDS

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report.

Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

QUALITY CONTROL - MATRIX SPIKES

Matrix spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report. Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

Matrix spike duplicates are calculated as relative percent difference using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean The original result is the analyte concentration of the matrix spike and the replicate result is the analyte concentration of the matrix spike duplicate. The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spike Duplicates were required for this job.

FOOTNOTES _

IS Insufficient sample for analysis. Sample listed, but not received. LNR

NATA Accreditation does not cover this analysis.

Address

This is to confirm that 9 samples were received on Thursday 22/9/2011. Results are expected to be ready by Friday 30/9/2011. Please quote SGS reference PE060993 when making enquiries. Refer below for details relating to sample integrity upon receipt.

Sample counts by matrix 9 Water Type of documentation received COC Date documentation received 22/9/2011 Samples received in good order Yes Samples received without headspace Yes Sample temperature upon receipt 14°C Turnaround time requested Sample container provider SGS Standard Samples received in correct containers Nο Sufficient sample for analysis Yes Sample cooling method Ice Bricks Samples clearly labelled Yes Complete documentation received Number of eskies/boxes received Yes

Samples will be held for one month for water samples and two months for soil samples from date of report, unless otherwise instructed.

COMMENTS

Sample MW5 and DUP01 do not have bottles supplied for organics analysis requested on COC. Trip01 and 02 are both labelled 01 and have incorrect bottles for analysis on COC.

As per conversation between James Gavshon and Mairead Tynan, Trip Blanks analysed for C6-C9 and BTEX. Organics analysis for samples MW5 and DUP01 disregarded. DB

To the extent not inconsistent with the other provisions of this document and unless specifically agreed otherwise in writing by SGS, all SGS services are rendered in accordance with the applicable SGS General Conditions of Service accessible at http://www.sgs.com/terms_and_conditions.htm as at the date of this document. Attention is drawn to the limitations of liability and to the clauses of indemnification.

COMMENTS

The document is issued in accordance with NATA's accreditation requirements. Accredited for compliance with ISO/IEC 17025. NATA accredited laboratory 2562(898/20210).

Samples "MW3", "MW4", "MW5" and "DUP01" were diluted due to high conductivity for metals. Hence the LORs were raised.

Total Fe and AI spike recovery for sample "MW1" was outside acceptance criteria due to high background.

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

METHOD SUMMARY

METHOD	
METHOD -	METHODOLOGY SUMMARY
AN020	Unpreserved water sample is filtered through a $0.45\mu m$ membrane filter and acidified with nitric acid similar to APHA3030B.
AN083	Separatory funnels are used for aqueous samples and extracted by transferring an appropriate volume (mass) of liquid into a separatory funnel and adding 3 serial aliquots of dichloromethane. Samples receive a single extraction at pH 7 to recover base / neutral analytes and two extractions at pH < 2 to recover acidic analytes. QC samples are prepared by spiking organic free water with target analytes and extracting as per samples.
AN114	Total Suspended and Volatile Suspended Solids: The sample is homogenised by shaking and a known volume is filtered through a pre-weighed GF/C filter paper and washed well with deionised water. The filter paper is dried and reweighed. The TSS is the residue retained by the filter per unit volume of sample. Reference APHA 2540 D. Internal Reference AN114
AN135	Alkalinity (and forms of) by Titration: The sample is titrated with standard acid to pH 8.3 (P titre) and pH 4.5 (T titre) and permanent and/or total alkalinity calculated. The results are expressed as equivalents of calcium carbonate or recalculated as bicarbonate, carbonate and hydroxide. Reference APHA 2320. Internal Reference AN135
AN135	Free and Total Carbon Dioxide may be calculated using alkalinity forms only when the samples TDS is <500mg/L. If TDS is >500mg/L free or total carbon dioxide cannot be reported. APHA4500CO2 D.
AN140	Acidity by Tritration: The water sample is titrated with sodium hydroxide to designated pH end point. In a sample containing only carbon dioxide, bicarbonates and carbonates, titration to pH 8.3 at 25°C corresponds to stoichiometric neutralisation of carbonic acid to bicarbonate. Method reference APHA 2310 B.
AN141	Determination of Fluoride by ISE: A fluoride ion selective electrode and reference electrode combination, in the presence of a pH/complexation buffer, is used to determine the fluoride concentration. The electrode millivolt response is measured logarithmically against fluoride concentration. Reference APHA F- C.
AN149	Sulphide by lodometric Titration: Sulphide is precipitated as zinc sulphide to overcome interferences with sulphite and thiosulphate. After filtration, sulphide is determined titrimetrically. Reference APHA 4500-S2-
AN258	Nitrate and Nitrite by FIA: In an acidic medium, nitrate is reduced quantitatively to nitrite by cadmium metal. This nitrite plus any original nitrite is determined as an intense red-pink azo dye at 540 nm following diazotisation with sulphanilamide and subsequent coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. Without the cadmium reduction only the original nitrite is determined. Reference APHA 4500-NO3- F.
AN261	Ammonia by Continuous Flow Analyser: Ammonium in a basic medium forms ammonia gas, which is separated from the sample matrix by diffusion through a polypropylene membrane. The ammonia is reacted with phenol and hypochlorite to form indophenol blue at an intensity proportional to the ammonia concentration. The blue colour is intensified with sodium nitroprusside and the absorbance measured at 630 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-NH3 H.
AN274	Chloride by Aquakem DA: Chloride reacts with mercuric thiocyanate forming a mercuric chloride complex. In the presence of ferric iron, highly coloured ferric thiocyanate is formed which is proportional to the chloride concentration. Reference APHA 4500CI-
AN275	Suphate by Aquakem DA: Sulphate is precipitated in an acidic medium with barium chloride. The resulting turbidity is measured photometrically at 405nm and compared with standard calibration solutions to determine the sulphate concentration in the sample. Reference APHA 4500-SO42 Internal reference AN275.
AN278	Reactive Phosphorus by DA: Orthophosphate reacts with ammonium molybdate (Mo VI) and potassium antimonyl tartrate (Sb III) in acid medium to form an antimony-phosphomolybdate complex. This complex is subsequently reduced with ascorbic acid to form a blue colour and the absorbance is read at 880 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-P F

Page 10 of 12 13-March-2012

METHOD SUMMARY

METHOD	
METHOD	METHODOLOGY SUMMARY
AN279/AN293	The sample is digested with Sulphuric acid, K2SO4 and CuSO4. All forms of phosphorus are converted into orthophosphate. The digest is cooled and placed on the discrete analyser for colorimetric analysis.
AN281	An unfiltered water or soil sample is first digested in a block digestor with sulphuric acid, K2SO4 and CuSO4. The ammonia produced following digestion is then measured colourimetrically using the Aquakem 250 Discrete Analyser. A portion of the digested sample is buffered to an alkaline pH, and interfering cations are complexed. The ammonia then reacts with salicylate and hypochlorite to give a blue colour whose absorbance is measured at 660nm and compared with calibration standards. This is proportional to the concentration of Total Kjeldahl Nitrogen in the original sample.
AN285	The term 'colour' is used here to mean true colour, that is, the colour of water from which turbidity has been removed. The term 'apparent colour' includes not only colour due to substances in solution, but also that due to suspended matter. Apparent colour is determined on the original sample without filtration.
AN311/AN312	Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500.
AN318	Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A.
AN320/AN321	Metals by ICP-OES: Samples are preserved with 10% nitric acid for a wide range of metals and some non-metals. This solution is measured by Inductively Coupled Plasma. Solutions are aspirated into an argon plasma at 8000-10000K and emit characteristic energy or light as a result of electron transitions through unique energy levels. The emitted light is focused onto a diffraction grating where it is separated into components.
AN320/AN321	Photomultipliers or CCDs are used to measure the light intensity at specific wavelengths. This intensity is directly proportional to concentration. Corrections are required to compensate for spectral overlap between elements. Reference APHA 3120 B.
AN403	Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36.
AN403	Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Petroleum Hydrocarbons (TPH) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with diffential polarity of the elluent solvents.
AN403	The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependant on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.
AN433/AN434	VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

COMMENTS

All the laboratory data for each environmental matrix was compared to SGS Environmental Services' stated Data Quality Objectives (DQO). Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the Chain of Custody document and was supplied by the Client. This QA/QC Statement must be read in conjunction with the referenced Analytical Report. The Statement and the Analytical Report must not be reproduced except in full.

All Data Quality Objectives were met with the exception of the following:

Extraction Date Acidity and Free CO2 6 items

> Alkalinity 7 items Colour by Discrete Analyser 6 items Sulphide by Titration in Water

Total and Volatile Suspended Solids (TSS / VSS) 3 items

Acidity and Free CO2 Analysis Date 6 items

> Alkalinity 7 items Colour by Discrete Analyser 6 items

Sulphide by Titration in Water 3 items

Trace Metals (Total) in Water by ICPMS Matrix Spike 1 item

SAMPLE SUMMARY

Sample counts by matrix 8 Water Type of documentation received COC 4/3/2012 Samples received in good order Yes Date documentation received 4.6°C Samples received without headspace Yes Sample temperature upon receipt Sample container provider SGS Turnaround time requested Standard Samples received in correct containers Yes Sufficient sample for analysis Yes Sample cooling method Ice Bricks Samples clearly labelled Yes Complete documentation received Yes Number of eskies/boxes received 2

HOLDING TIME SUMMARY

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field Sampling Guide for Containers and Holding Time" (ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

Extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and analysis dates are shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

SURROGATES

PE065491 R0

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

VOCs in Water Method: ME-(AU)-[ENV]AN433/AN434

13/3/2012 Page 7 of 14

Duplicates are calculated as Relative Percentage Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: MAD = 100 x SDL / Mean + LR

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifier when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

LABORATORY CONTROL SAMPLES

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA /QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended dagger symbol (†) when outside suggested criteria.

MATRIX SPIKES

Matrix Spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of this report.

Recovery is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

MATRIX SPIKE DUPLICATES

PE065491 R0

Matrix spike duplicates are calculated as Relative Percent Difference (RPD) using the formula: RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The original result is the analyte concentration of the matrix spike. The Duplicate result is the analyte concentration of the matrix spike duplicate.

The RPD is evaluated against the Maximum Allowable Difference (MAD) criteria and can be graphically represented by a curve calculated from the Statistical Detection Limit (SDL) and Limiting Repeatability (LR) using the formula: $MAD = 100 \times SDL / Mean + LR$

Where the Maximum Allowable Difference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Red with an appended reason identifer when outside suggested criteria. Refer to the footnotes section at the end of this report for failure reasons.

No matrix spike duplicates were required for this job.

13/3/2012 Page 13 of 14

PE065491 R0

Samples analysed as received.

Solid samples expressed on a dry weight basis.

QC criteria are subject to internal review according to the SGS QA/QC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-11.pdf

- * Non-accredited analysis.
- Sample not analysed for this analyte.
- ^ Analysis performed by external laboratory.
- IS Insufficient sample for analysis.

 LNR Sample listed, but not received.

 LOR Limit of reporting.
- QFH QC result is above the upper tolerance.
- QFL QC result is below the lower tolerance.
- ① At least 2 of 3 surrogates are within acceptance criteria.
- 2 RPD failed acceptance criteria due to sample heterogeneity.
- 3 Results less than 5 times LOR preclude acceptance criteria for RPD.
- Recovery failed acceptance criteria due to matrix interference.
- ® Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).
- © LOR was raised due to sample matrix interference.
- ① LOR was raised due to dilution of significantly high concentration of analyte in sample.
- ® Reanalysis of sample in duplicate confirmed sample heterogeneity and inconsistency of results.
- Low surrogate recovery due to the sample emulsifying during extraction.
- † Refer to Analytical Report comments for further information.

Annex I

QAQC Summary

1 QA/QC SUMMARY

Field duplicates, field triplicates, equipment rinsate and transport blanks were collected as field based quality control samples. Results are discussed below.

1.1 PRIMARY/DUPLICATE ANALYSIS

RPD% were calculated for primary/field-duplicate sample pairs where possible (i.e. where concentrations of an analyte were above the LOR in both the primary and quality control sample). In this project RPD% in the range of 0 - 30% were considered to represent adequate accuracy and precision, with only those RPD% falling outside this range scrutinised for further detailed assessment.

Three primary/duplicate sample pairs were collected over the course of this investigation representing a rate of one in five. Of the 63 RPD% able to be determined for the primary/duplicate or triplicate pairs only 2 were above 30%.

RPD% exceeding 30% were calculated from groundwater concentrations of Kjeldahl Nitrogen (40%) and Total Suspended Solids (44%) for the MW5/DUP01 primary/duplicate pair collected during the February 2012 groundwater monitoring event.

Given the low concentration of Nitrogen the actual difference in concentrations between the two samples is actually quite small. On this basis any apparent lack of accuracy or precision in the analytical data is not considered to negatively affect the interpretative value of the dataset for the purpose of this investigation.

1.2 TRIP BLANK AND RINSATE ANALYSIS

Rinsate samples using laboratory supplied water were collected during each of the groundwater investigations to provide confidence in the decontamination procedures used to prevent cross contamination between monitoring wells. Samples were analysed for a metals suite consistent with that used in the analysis of primary samples.

Trip blanks were included in the eskies used to transport samples to the laboratory to provide assurance in the sample handling procedure and to identify any potential cross contamination between samples during transportation. Trip blanks comprised of laboratory prepared bottles containing a blank water sample.

Analytes detected at concentrations greater than the laboratory limits of reporting in QA/QC samples are described below:

1) Zinc (0.009 mg/L) and aluminium (0.002 mg/L) were identified in the rinsate sample collected during the April 2011 GME;

- 2) Zinc (0.012 mg/L) was identified in the trip blank sample analysed during the April 2011 GME;
- 3) Zinc (0.005 mg/L) was identified in the rinsate sample collected during the September 2011 GME;
- 4) Toluene (0.6 mg/L) was identified in the trip blank sample analysed during the September 2011 GME; and
- 5) Sodium (2 mg/L), magnesium (0.1 mg/L) and zinc (0.007 mg/L) were identified in the rinsate sample collected during the February 2012 GME.

Zinc was identified in all rinsate and trip blank samples at very low concentrations. Given the presence of zinc in the trip blank sample which did not come in contact with any of the sampling equipment it is considered likely that the zinc identified in the rinsate samples is in fact a product of the laboratory supplied water. Furthermore, the fact that the concentrations identified in the QA/QC samples are significantly lower than those identified in the groundwater samples, any perceived lack of precision associated with the analysis of zinc is unlikely to affect the interpretative value of the data.

The concentrations of sodium and magnesium identified in the February 2012 rinsate sample are only marginally above or on the laboratory limits of reporting and are not considered to represent contamination during the rinsing of sampling equipment. Any perceived lack of precision associated with the analysis of these analytes is unlikely to affect the interpretative value of the data for the purpose of this investigation.

Given that toluene was not identified in any of the primary groundwater and is not considered to be a chemical of potential concern at the Site it is unlikely that the concentrations identified in the trip blank sample analysed as part of the September 2011 GME represents a cross contamination issue. On this basis, its detection in the QA/QC sample is not considered to be representative of any impacts of groundwater at the Site and has not been considered further during the interpretation of data during this investigation.

Overall the QA/QC samples collected during the three groundwater investigations provide confidence in the decontamination procedures and transportation of samples to the laboratory.

1.3 LABORATORY QA/QC

The analytical methods implemented and reported by the laboratories were performed in accordance with their scope of NATA accreditation and consistent with Schedule B(3) of the NEPM. The laboratories generally reported an adequate range and frequency of data quality information (including laboratory duplicates, control samples, surrogate recoveries and spike recoveries) for the purposes of this assessment. The reported laboratory

data quality information was acceptable with the following exceptions and their potential effects on data quality are summarised below.

SGS Job Number PE057307

Holding times were exceeded for the analysis of alkalinity and hexavalent chromium. As a result there is the potential that these analytes have been under reported due to potential sample decomposition. The results for alkalinity during this round of analysis are consistent with those reported for the following investigations and therefore considered to be suitable for the purpose of this investigation. Given that hexavalent chromium was not identified in four out of five samples and at very low concentrations in the fifth any minor variation in the concentrations associated with the breach in holding times is not considered to affect the interpretative value of the data for the purpose of this investigation.

The matrix spike recovery for manganese was outside of the laboratory acceptability criteria due to concentrations in the primary sample exceeding that of the spike. Given the volume of compliant data quality information provided by the laboratories, the potential lack of accuracy represented by issues with a limited number of spike recoveries for some compounds is not considered to compromise the quality of the data overall.

SGS Job Number PE060993

Holding times were exceeded for the analysis of alkalinity and acidity. As a result there is the potential that these parameters have been under reported due to potential sample decomposition. The results for both parameters during this round of analysis are consistent with those reported for the other investigations and therefore considered to be suitable for the purpose of this investigation.

Spike recoveries for aluminium, iron and sulphate were all outside of the acceptance criteria due to high background concentrations. Given the volume of compliant data quality information provided by the laboratories, the potential lack of accuracy represented by issues with a limited number of spike recoveries for some compounds is not considered to compromise the quality of the data overall.

SGS Job Number PE065491

Holding times were exceeded for the analysis of alkalinity, acidity, sulphide and total suspended solids (TSS). The results for alkalinity, acidity and TSS during this round of analysis are consistent with those reported for the previous investigations and therefore considered to be suitable for the purpose of this investigation. There is the potential that concentrations of sulphides have been under reported as a result of the extended holding times. However sulphides were not detected above the laboratory limits of reporting in the samples that were analysed both within and outside of holding time limits. On this basis it is considered that the interpretative value of the data

collected from those samples analysed outside of the recommended is suitable for the purpose of this investigation.

Matrix spike recovery for iron was outside of the acceptance criteria due to high background concentrations. Given the volume of compliant data quality information provided by the laboratories, the potential lack of accuracy represented by issues with a limited number of spike recoveries for some compounds is not considered to compromise the quality of the data overall.

2017 Compliance Assessment Report Ministerial Statement 870 Technical Ammonium Nitrate Plant

OEPA Reference: CA01-2013-0018

Dear Mr Taylor,

RE: GROUNDWATER MONITORING WELL RE-LOCATION

1. INTRODUCTION

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by Yara Pilbara Nitrates Pty Ltd (YPNPL) to support them in addressing environmental non-compliances (NC) highlighted in the OEPA's letter dated 15 January 2014. This letter specifically responds to the request for:

'Details of the design, construction and location of the bores installed to replace groundwater monitoring bores MW1 and MW4 and the reasons and rationale for replacing the bores...'

The OEPA require action by 14 February 2014 to resolve the NC. This letter sets out the information required together with *Annexes A* and *B* which provide location details and the 'Monitoring Well Installation' report issued by GHD respectively.

2. PROJECT APPRECIATION

The site (including temporary laydown areas) occupies approximately 35 ha of land in the north-western section of Lot 3017. Lot 3017 totals approximately 49 ha and is located within the Burrup Industrial Estate (BIE). The existing ammonia fertiliser plant is situated adjacent to the western boundary of Lot 3017.

The civil works for the TANPF have now been completed and construction works commenced. The Project is on target for commissioning in Q1 2015. During civil works activities, 2 of the 5 groundwater monitoring bores (MW1 and MW4) installed by ERM to periodically monitor groundwater conditions under Condition 8-4 of Ministerial Statement No. 870 were damaged and have been replaced.

3. REPLACEMENT WELL INSTALLATION

3.1 INTRODUCTION

Figure 1 of Annex B (p4) has been marked up to show the approximate original location of wells MW1 and MW4 in relation the proposed TANPF layout. MW1 was originally located in the vicinity of proposed site road no. 3 to the north west of the TANPF, and MW4 within the proposed Nitric Acid plant to the south west of the TANPF. As a result, YPNPL sought to find viable relocation sites for the wells.

3.2 NEW LOCATIONS

New representative well locations were selected by ERM in consultation with YPNPL (*Annex A* and *Figure 1* of *Annex B*). The well positions were relocated in consideration of updated proposed TANPF layout, intending to fulfil the same purpose as the original positioned wells while being located in locations protected from construction activities.

A location for replacement MW1 was chosen to the north west of the original well location, just within the fenced site boundary. A location for replacement MW4 was chosen to the south east and immediately down gradient of the original well location between Contaminated Surface Water Storage Ponds 4 and 5, as close to the fence line as practicable.

The location of the current wells in relation to the original locations is also shown in *Annex A. Table 1* of *Annex B* (p3) provides the coordinates of the relocated wells MW1 and MW4.

It is noted that the replacement wells were drilled as near to the original locations as possible but do differ in terms of elevations.

3.3 REASONS AND RATIONALE FOR REPLACING THE BORES

The reasons for relocation as stated in the previous section are related to the proposed layout of the TANPF. The Project's Construction Water Quality Management Plan (reference 2-250-329-PRO-TRE-0118) prepared for YPNPL's principal contractor noted that 'Existing groundwater monitoring well locations shall be retained where possible, however, it is noted that several locations are present within the building footprint. Groundwater monitoring wells present within the building footprint will be decommissioned in accordance with relevant WA guidelines and internationally recognised industry standards at the commencement of construction.'

To avoid interference with construction activities and proposed operations, the wells have been relocated to representative sites with respect of location and the likely interception of analytes as related to particular parts of the facility.

ERM consider that the locations of the replacement wells are representative of the original well locations on the following basis:

- MW 1 is positioned at an up hydraulic gradient location near the northern perimeter of the Site to continue to monitor background groundwater quality; and
- MW 4 is installed adjacent to potential sources of contamination in Contaminated Surface Water Ponds 4 and 5 and down hydraulic and topographic gradient of the Site to enable the evaluation of any potential impacts in relation to water quality contamination as a result of construction activities.

It is noted that the contaminated water pond design has changed from a single membrane to a double membrane design with a leak detection system between the membranes. A leak would trigger action to replace the membranes. The risk of a leak from the ponds to groundwater is therefore considered low.

3.4 CONSTRUCTION

Section 2 of Annex B provides details of the well installation methodology. In summary, the replacement wells were redrilled on Saturday 7 September 2013 using an airlift method (to remove introduced fluids) in accordance with:

- Water Quality Protection Note 30: Groundwater Monitoring Bores,
 Department of Water, Government of Western Australia; and
- Minimum Construction Requirements for Water Bores in Australia, February 2012, Third Edition.

3.5 DESIGN

The replacement wells were constructed with 50 mm Class 18 PVC casing and a lockable protective casing extending approximately 700 mm above ground level. *Appendix A* of *Annex B* to this report provides well logs which detail the design of the wells. The design of the replacement wells is considered consistent with the objectives of the original well design in terms of intercepting groundwater analytes/ contaminants.

It is noted that the drilling and installation of replacement wells MW1 and MW4, has resulted in a variation of well depth. The deeper screens in the replacement wells could potentially lead to variation in groundwater chemistry where sampled as compared with the original MW1 and MW4 wells. This is due to different part of the aquifer is being sampled (i.e. the deeper in the bedrock profile and closer to the tidal flats the likelihood of higher salinity). Should future sampling show consistent concentrations representative of natural background conditions in these replacement wells that are outside of the current trigger limits, there may be a need to review and propose revised trigger levels.

4. SUMMARY

Overall, the replacements wells MW1 and MW4 are considered fit for purpose in continued groundwater monitoring in accordance with Condition 8-4 of Ministerial Statement No. 870 given the relative locations of the well in relation to the objectives of groundwater construction monitoring. While there are minor variations in the design of the wells when compared to the original installations, it is considered that these differences will only affect the interception of natural groundwater chemistry in the monitoring process, and will not affect the effectiveness of the wells in monitoring potential contaminants connected with the construction and operation of the TANPF.

Should you require any clarification please contact the undersigned.

Yours sincerely,

for Environmental Resources Management Australia Pty Ltd

1. Introduction

This report describes the installation of two (2) monitoring wells on the Technical Ammonium Nitrate (TAN) production site, to replace existing wells that had been destroyed during facility construction.

1.1 Background

Yara Pilbara Nitrates Pty Ltd (YPNPL) formerly Burrup Nitrates Pty Ltd (BNPL) is joint venture between Yara, Orica and Apache. YPNPL is developing a Technical Ammonium Nitrate (TAN) production facility on the Yara Pilbara Peninsula near Karratha in the Shire of Roebourne, Western Australia. When completed, the TAN will be owned by YPNPL, operated by Yara International ASA and marketed by Orica Limited.

The TAN production facility will be located adjacent to the existing ammonia plant in the Burrup industrial estate is operated by Yara Fertilisers Pty Ltd, and will include:

- Process plants;
- Utilities area;
- Storages for finished product; and,
- Several buildings including a workshop, central control room, laboratory, safety and security gatehouse, administration office and staff amenities.
- Regulatory approval has been requested for Site D within King Bay/Hearson Cove Industrial Precinct on the Burrup Peninsula, approximately 13km northwest of Karratha Western Australia (WA) and construction commenced in 2012 with the TAN expected to be fully commissioned by the last quarter of 2014.

1.2 Assumptions and Limitations

This report: has been prepared by GHD for Tecnicas Reunidas and may only be used and relied on by Tecnicas Reunidas for the purpose agreed between GHD and the Tecnicas Reunidas as set out Section 1 of this report.

GHD otherwise disclaims responsibility to any person other than Tecnicas Reunidas arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

2. Monitoring Well Installation

Monitoring wells MW1 and MW4 were installed by Envirotech Drilling with a Comacchio MC405 rotary drill rig by Rotary Air Blast (RAB) and down hole hammer, on Saturday 7th September 2013. The well locations are presented in Figure 1 and installation details are summarised on Table 1.

Table 1 Installation Summary

Well Number	Easting ¹	Northing ¹	Screen interval (mbgl)	Groundwater Intersection (mbgl)
MW1	477660	7719655	7.5 – 16.5	10
MW2	477787	7719227	7.5 – 13.5	8.25

¹ GDA94 MGA zone 50

Both wells were constructed with 50 mm Class 18 PVC casing, screened across the interpreted water table (groundwater intersection), and completed with lockable protective casing extending approximately 700 mm above ground level. Well construction and lithology encountered is presented in Appendix A and photographs are presented in Appendix B.

The wells were developed by airlift methods to remove introduced fluids. The development yields were low, with the southern bore, MW4, yielding approximately 0.1 L/s. The development yield of MW1 was lower and intermittent. The low yields are attributable to the low conductivity of the lithology encountered, which largely comprised clayey materials and rock (granophyre). Consequently, it was not possible to measure yields or water quality parameters during drilling.

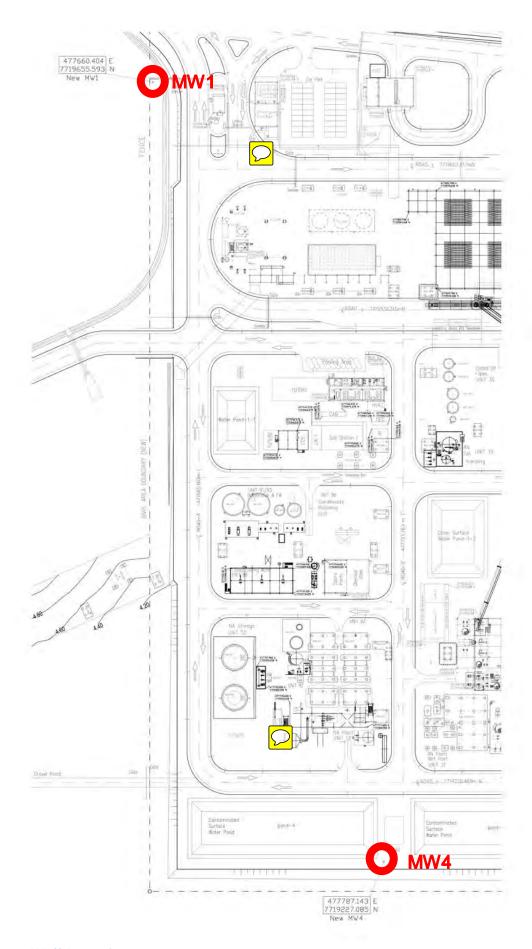

Figure 1 Well Locations

3. Conclusion

While the low yield of the wells during and after construction is a consequence of the lithology encountered, these wells will be suitable for groundwater level and quality monitoring purposes.

Chief Executive Officer
Office of the Environmental Protection Authority
Locked Bag 10
East Perth WA 6892

Email: compliance@epa.wa.gov.au, matt.spence@epa.wa.gov.au,

Dear Sir,

Subject: Response to Statement 870 Compliance Audit Report

Yara Pilbara Nitrates Pty Ltd (YPN) has completed the actions identified by OEPA as requiring verification, as advised in the letter dated 21 November 2016 regarding the Desktop Audit of Statement 870.

An independent botanist was engaged by YPN and conducted a survey of the Technical Ammonium Nitrate (TAN) plant site on 21 December 2016. The inspection detected no weed species that were not present at site prior to the development of the TAN plant. Due to the timing of the inspection being sub-optimal, a follow up survey is planned later in this wet season. A copy of the survey report is attached.

Ongoing investigation by YPN into the elevated levels of Total Nitrogen detected in groundwater bores on site has been unable to detect any plausible causes related to the development of the TAN plant. Elevated nitrogen levels have been detected in MW1 which is a location just within the plant boundary and upgradient of the TAN plant (ie this bore is intended to measures groundwater quality of groundwater that flows into the TAN plant site).

To increase the confidence that results from MW1 are representative of offsite groundwater quality YPN is installing an additional bore upgradient of the plant site, at a nominal location shown in the attached figure (yellow stars indicate nominal locations of new bore, and redevelopment of an existing bore at Yara Pilbara Fertilisers Ammonia Plant). This new bore is planned to be installed in time to be included in the next TAN plant groundwater monitoring event scheduled for Q2 2017, the results of which will be reported to the OEPA.

If you have any queries please do not hesitate to contact Susan Giles, Environmental Superintendent on 9183 4167 or susan.giles@yara.com.

Yours Sincerely,

Brian HOWARTH

HESQ Manager

1. Introduction

Yara Pilbara Nitrates Pty Ltd (YPN) has recently constructed a Technical Ammonium Nitrate (TAN) Plant on the Burrup Peninsula and is soon to commence production. Ministerial Statement 870 (MS870), which gave approval for the TAN Plant project to proceed includes the following Conditions which need to be complied with:

Condition 6.1.5: No new species of weeds (including both declared weeds and environmental weeds) shall be introduced into the area as a result of the implementation of the proposal; and **Condition 6.1.6**: The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring undertaken prior to the commencement of operations, or exceed that existent on comparable, nearby land which has not been disturbed during implementation of the proposal.

The TAN Plant has been constructed and is being commissioned by Engineering Procurement and Construction (EPC) contractor Technicas Reunidas(TR). TR has implemented some weed control to comply with their Construction Environmental Management Plan during the construction period (Tecnicas Reunida 2012). However in the 2016 MS870 Compliance Assessment Report, YPN was not able to demonstrate that there had been no new weed species introduced to the plant site during construction. There YPN committed to undertaking a weed survey by a qualified botanist to ascertain the presence and relative abundance of weed species at the TAN Plant site.

YPN received correspondence from the Office of Environmental Protection Authority (OPEA) responding to the submitted Compliance Assessment Report and asking YPN for a response on the status of weeds on the site by January 31st 2017.

To achieve a comprehensive weed survey, YPN requested Vicki Long & Associates (VLA) conduct a weed survey of their Burrup TAN plant site and lease area. This report presents the results of that survey.

2. Scope

The scope of work was to conduct a weed survey of Lot 3017, Village Road, Burrup (the TAN Plant site and lease); to identify and locate (with hand held GPS) any declared and/or environmental weeds present. Weed presence and abundance was to be compared with the project baseline survey data.

3. The Site

The Yara TAN Plant site is located on the eastern side of the Burrup Peninsula (Murujuga) on the Pilbara coastline, some 20 km north of Karratha within the Burrup Strategic Industrial Area. It sits on the northern side of the King Bay tidal inlet and west of Hearson Cove. The Yara TAN site is 4-9 hectares (ha), of which the TAN Plant comprises some 33.11 ha.

The site was, pre-construction, biologically complex, extending from the lower toe of the rocky hill slopes to the north across coastal flats and small sandy "islands" tapering to the tidal inlet to the south. The Level 1 botanical survey conducted for the Public Environmental Review (PER) (Outback

Ecology Services 2010) discusses five broad vegetation types over the TAN Plant site, although it does appear from the vegetation map in that report (Figure 2 of Annex 1) (ERM 2010) that 15 vegetation communities actually occurred on the site pre-construction. The remnant vegetation within the lease area that are outside of and to the south of the plant site identified in the baseline survey (Outback Ecology Services 2010) are based on the Trudgen report (2002) mapping and are described as:

AbTeWa (coastal flats): High open to open heath of Acacia bivenosa, A. coriacea subsp coriacea over low open shrubland over Triodia epactia hummock grassland and mixed closed grasses over herbs, and:

Sm (saline inlet and supratidal flats): Tecticornia spp. Scattered low shrubs to open heath.

4. Methods

Aerial photos were used to identity survey areas both within and beyond the plant site. All areas were traversed by foot. At each weed location the following attributes were recorded.

Table 1: Attributes recorde	d at weed	locations in	2016 survey
-----------------------------	-----------	--------------	-------------

Attribute	Description
Species name	Current taxonomic species name of all weed species
Collection Id	Unique identifying code was assigned if a specimen was collected
Location	Coordinates of the weed point location (GDA94)
Recorder and date	Personnel involved in sampling at location and survey date
Cover (within a stated	An estimate of foliar cover as a percent value (1; 5; 10; 20; 30; 40; 50; 60; 70; 80;
area)	90 and 100)
Life Stage	Non-flowering; Flowering; Set Seed; Seeding

5. Survey Personnel and Timing

The field survey was conducted by Vicki Long, a botanist/ecologist with over 30 years of experience in the Pilbara. Vicki has been involved in numerous weed surveys on the Burrup Peninsula and coastal Pilbara and is well qualified to detect new incursions and assess current infestations. Vicki was accompanied by Yara vacation student Rhys Katich who was gaining work experience with Yara.

The survey of the Yara TAN lease was conducted on 21st December 2016. No significant rainfall had been received since June and July 2016 when 71 mm and 58 mm of rainfall were received respectively. This meant that many weeds had already senesced, or were senescing apart from those located in more disturbed areas (edges of roads, fencelines, soil stockpiles). Additionally many weed species die back to root-stock in the absence of rain; these would not have been detected during this survey. Timing, due to the dry climate, was seen as a limitation to the accuracy of the survey.

6. Taxonomy and Nomenclature

All species recorded were able to be identified in the field by the surveying botanist.

7. Results

7.1 Vegetation Condition - General

When discussing "Vegetation Condition" the baseline report (Outback Ecology Services 2010) indicates that "the eastern and southern parts of the site are heavily invaded by *Cenchrus ciliaris* to the extent that it forms a Closed Grassland in parts (>70%)". This indicates that the vegetation structure has changed somewhat since the Trudgen mapping in 2000 (Trudgen 2002). The Outback Ecology baseline report does indicate that Dr Arthur Weston, as consultant botanist who assisted with the Trudgen survey, commented that *C. ciliaris* (buffel grass) had increased in dominance and cover since the 2000 field survey. The author of this report was the third consultant botanist for the Trudgen survey and concurs with the comments made by Dr Weston. However it appears that since the baseline survey, the condition of the vegetation has not significantly changed and the cover of buffel grass remains similar. During this survey, three vegetation types were described (based on Aplin 1979 – see Appendix A) in the lease area beyond the plant site and immediate infrastructure, which have now replaced those recorded by Trudgen and used for the baseline survey.

Vegetation as it currently (2016) occurs and its current condition in the area is described in Table 2.

Table 2: Vegetation descriptions for remnant vegetation east and south of Yara TAN plant site (within lease)

Code	Vegetation Description ¹	Condition ²
AbTttCc	Acacia bivenosa open (2-10%) to scattered (<2%) tall shrubland over open Trianthema turgidifolia low shrubland (2-10%) over Cenchrus ciliaris tussock grassland (30-70%) to closed tussock grassland (70-100%) with patchy (<2%) Triodia epactia on sandy flats.	Very Poor
СсТѕр	Cenchrus ciliaris closed tussock grassland (70-100%) with scattered (<2%) low shrubs of Tecticornia species and Trianthema turgidifolia fringing tidal inlet.	Completely Degraded
Tspp	Tecticornia species low open shrubland (2-10%) to scattered low shrubs (<2) on tidal inlet.	Very Good

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

7.2 Weed Species Recorded

Two weed species only were recorded within the Yara TAN lease during the December 2016 survey. These were *Cenchrus ciliaris* (buffel grass) and *Aerva javanica* (kapok) and both species have been recorded in previous surveys. The Department of Parks and Wildlife (DPaW) classify weeds in each region, termed "environmental weeds". These are weeds that may impact on natural, rather than agricultural or horticultural, values and are assessed based on invasiveness, ecological impact, potential and current distribution and the feasibility for control. The priority for management is defined by these risk rating categories (Parks and Wildlife 2015). Weed categories and management recommendations are given in Appendix B.

With regard to the weed rankings, it should be remembered that they are formulated for the entire Pilbara region, much of which is under pastoral lease where buffel grass in particular is a highly

²Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

valued fodder species. Both buffel grass and kapok are now widespread in the Pilbara and control is no longer a feasible option for the wider area. The Burrup Peninsula however, like some offshore islands, is still relatively weed-free apart from in the Industrial Zone. The vegetation types found on the Burrup Peninsula (Murujuga National Park) are not replicated anywhere else on the Pilbara mainland (Trudgen 2002). Put into context, the vegetation of the Burrup is unique and has high conservation value. Given this, the fact that Murujuga National Park is a tourist asset and the globally acknowledged heritage value of the rock art, these weed rankings for the Burrup Peninsula should be locally re-evaluated.

Table 3: Inventory of weed species recorded within the Yara TAN lease, weed policy classifications and recommended management options. (Australian Weeds Committee 2012; Department of Parks and Wildlife 2013)

Species Name (common name)	Classification ¹
Aerva javanica (kapok)	Environmental weed (Low; D,E)
Cenchrus ciliaris (buffel grass)	Environmental weed (Low, D)

¹Management actions that may be considered for each ranking are included in Appendix B.

These two species were both recorded present in the Level 1 baseline survey conducted for the PER in March 2009 (Outback Ecology 2009). *Vachellia farnesiana* recorded during that survey was not detected in this 2016 survey.

7.3 Cover and Life Stage

Plant Site

The plant site is comprised of two distinct areas: the operating plant area and the surrounding infrastructure, office and boundary areas.

The operating plant area is heavily gravelled which results in very low weed presence (0-<1%).

The area peripheral to the operating plant area includes stony batters, office sites on surfaces of dirt or cracker dust, mostly dis-used laydown areas and an area of stockpiled soil. These areas had varying weed presence and abundance. Kapok was the most recorded species and cover ranged <1% to 10% to 20% to 60% at some weed record points. Buffel grass was less abundant and ranged from <2% to 10%. Abundances are mapped in Appendix C Figure 1.

Kapok was generally recorded as flowering and seeding (plants seed from the terminal part of the inflorescence while still flowering lower down the spike). Buffel grass had generally completed its reproductive stage although isolated plants were still seeding.

Lease area south and south east of Plant Site

The area outside the plant site fence (but within Yara TAN's lease) to the east and south east was heavily infested with buffel grass. Both areas had an estimated buffel grass cover of 70% to 80% of the total area. Unlike within the plant site, kapok in this area had significantly died back for the season. It was estimated at 10% cover but it is anticipated that figure would be much higher following effective rainfall. Abundances are mapped in Appendix C Figure 1.

7.4 Comparison with Previous Weed Mapping

The Scope of Works requirement to compare the type and abundance of weeds to the baseline survey can only be done superficially for the following reasons:

- The baseline survey report (Outback Ecology 2010) describes the vegetation condition as ranging from "Very Good to Degraded" but these areas are not presented on a map. Additionally, there is no indication as to which Vegetation Condition Scale these ratings were derived from and no definitions are given. At best it is reported that the "north-east corner" of the site is in "Very Good condition" with patches of *Cenchrus ciliaris* (buffel grass) and *Aerva javanica* (kapok). The eastern and southern parts of the site were reported as being "heavily invaded by *C. ciliaris* to the extent that if forms a Closed Grassland in parts (>80% cover)". One can only assume the heavily infested areas would be classified as Very Poor or Degraded, depending on the Vegetation Condition Scale used.
- A comparison of abundance and density with baseline data can only be made in the
 undisturbed areas to the east and south of the plant area. Conditions within the plant site
 itself have changed significantly. New weed invasions can, however, be detected over all
 areas.
- Weed mapping was conducted in July and October 2013 and a map is included in the Compliance Report for Weed Management Attachment 04 Weed Mapping Report (Tecnicas Reunidas 2014). The map does show the location of buffel and kapok and "fumigation" efforts in 2013 but does not indicate abundance.

From the previous literature available, it appears that the locations of buffel and kapok within the plant site area have remained the same but there has been further spread into the western side of the plant site and along the access road into the site since 2013. A comparison of species abundance cannot be commented on. The area outside the plant site, on the eastern and southern sides of the lease appears to have remained constant since the baseline survey, although the estimation of kapok cover in this area was more difficult to achieve accurately due to plants being senesced at the time of the December survey.

The MS870 Condition 6.1.6 states "The coverage of weeds (including both declared weeds and environmental weeds) within the rehabilitation areas shall not exceed that identified in baseline monitoring .." As Yara have not undertaken any specific revegetation to date, the Scope of Work requirement to compare current abundances with baseline survey goes beyond compliance and shows environmental integrity.

A weed map is presented in Appendix C Figure 1.

8. Discussion and Recommendations

Whilst the weed ranking for both kapok and buffel grass is "low," the management options (DPaW 2013) for these weeds are "D – Protect Priority Sites" and "E – Targeted control to reduce infestations at priority sites". Given the high conservation value of the vegetation of the Burrup Peninsula, these management options to keep weeds contained and or controlled within the Yara TAN plant site is sound environmental practice. In saying this the eastern and southern area beyond the plant site are now in very poor to degraded condition and it is not likely that buffel grass could

be controlled in this area, nor would it be cost and time effective to do so. Based on the results of this survey the following recommendations are made.

- A weed survey be conducted at a more appropriate time following sufficient rainfall in order to gain a better understanding of weed presence and abundance within the Yara TAN lease.
- Yara TAN consider a weed program for each species based on risk, time and resources to ensure effectiveness of weed control.
- Within the plant site, both buffel grass but particularly kapok should be controlled. Lower
 priority can be given to gravelled areas, and high priority to the outer boundaries of the
 plant site particularly along the northern and western boundaries.
- Control methods and timing should be undertaken according to a Weed Management Plan which will indicate best times for treatment.
- The eastern and southern area outside the plant site area should be monitored at appropriate times and following sufficient rainfall to check for any new weed incursions only. Control is not considered viable in this area.
- A weed audit to check for new weed incursions and to assess the effectiveness of weed treatment should be done annually as dictated by a Weed Management Plan.

APPENDIX A Vegetation Description Scale and Vegetation Condition Scale

Vegetation Structural Classes¹

Stratum	Canopy Cover (%)					
	70-100%	30-70%	10-30%	2-10%	<2%	
Trees over 30 m	Tall closed forest	Tall open forest	Tall woodland	Tall open woodland	Scattered tall trees	
Trees 10-20 m	Closed forest	Open forest	Woodland	Open woodland	Scattered trees	
Trees under 10 m	Low closed forest	Low open forest	Low woodland	Low open woodland	Scattered low trees	
Shrubs over 2 m	Tall closed scrub	Tall open scrub	Tall shrubland	Tall open shrubland	Scattered tall shrubs	
Shrubs 1-2 m	Closed heath	Open heath	Shrubland	Open shrubland	Scattered shrubs	
Shrubs under 1 m	Low closed heath	Low open heath	Low shrubland	Low open shrubland	Scattered low shrubs	
Hummock grasses	Closed hummock grassland	Hummock grassland	Open hummock grassland	Very open hummock grassland	Scattered hummock grasses	
Grasses, Sedges Herbs	Closed tussock grassland / bunch grassland/ sedgeland / herbland	Tussock grassland / bunch grassland /sedgeland / herbland	Open tussock grassland / bunch grassland /sedgeland / herbland	Very open tussock grassland / bunch grassland /sedgeland / herbland	Scattered tussock grasses / bunch grasses/ sedges/ herbs	

¹Vegetation descriptions are based on Muir(1977) and Aplin's (1979) modification of the vegetation classification system of Specht (1970): Aplin T.E.H. (1979). The Flora. Chapter 3 in O'Brien B.J. (ed) 1979 *Environment and Science* University of Western Australia Press.

Vegetation Condition Scale¹

E = Excellent

Pristine or nearly so; no obvious signs of damage caused by the activities of man.

VG = Very Good

Some relatively slight signs of damage caused by the activities of man. For example, some signs of damage to tree trunks caused by repeated fire, the presence of some relatively non-aggressive weeds, or occasional vehicle tracks.

G = Good

More obvious signs of damage cuased by the activities of man, including some obvious impact on the vegetation structure such as that caused by the low levels of grazing or by selective logging. Weeds as above plus some more aggressive weeds.

P = Poor

Still retains some basic vegetation structure or ability to regenerate to it after very obvious impacts of activities of man, such as grazing, partial clearing (chaining) or frequent fires. Weeds as above plus some more aggressive weeds.

VP = Very Poor

Severely impacted by grazing, very frequent fires, clearing or a combination of these activities. Scope for some regeneration but not to a state approaching good condition without intensive management. Usually with a number of weed species including very aggressive species.

D = Completely Degraded Areas that are completely or almost completely without any native species in the structure of their vegetation: ie areas that are cleared or "parkland cleared" with their flora comprising weed or crop species with isolated native trees or shrubs.

¹Vegetation Condition Scale is based on Trudgen M.E. (1988). A Report on the Flora and Vegetation of the Port Kennedy Area. Unpublished report prepared for Bowman, Bishaw and Associates West Perth.

APPENDIX B Weed Classifications

Weed Classifications

Weeds of National Significance (WONs)

Thirty-two WoNS have been agreed by the Australian State and Territory governments, based on the weed species' invasiveness, potential for spread and environmental, social and economic impacts (Australian Government, 2011). In Western Australia, many WoNS are also declared pests under the BAM Act.

Declared Pests

The Department of Agriculture and Food Western Australia (DAFWA) regulates weeds under the Biosecurity and Agriculture Management Act 2007 (BAM Act), which supersedes the Agriculture and Related Resources Protection Act 1976. Weeds are grouped into four main classifications (Table 1).

Table A.4: Categorisation of plants under the BAM Act

Category	Description
Permitted organisms under section 11	Organisms that are allowed entry into Western Australia
Prohibited organisms under section 12	Organisms that are prohibited from entry into Western Australia
Unlisted organisms under section 14	If an organism cannot be categorised as either permitted or prohibited the organism will be unlisted
Declared pest under section 22	Pests that may be in the State but are under official containment, control or eradication

Plants that are prevented entry into the State or have control or keeping requirements within the State are declared pests. Declared pests can be assigned to a C1, C2 or C3 category under the BAM Act Regulations 2013. Prohibited organisms can be assigned to a C1 or C2 control category (Table 2).

Table A.5: Categories of declared pests under the BAM Act regulations.

Category	Description
C1 Exclusion	Plants which should be excluded from part or all of Western Australia.
C2 Eradication	Plants which should be eradicated from part or all of Western Australia.
C3 Management	Plants that should have some form of management applied that will alleviate the harmful impact of the plant, reduce the numbers or distribution of the plant or prevent or contain the spread of the plant.

Landholders, managers and occupiers of land are responsible for the management declared pests on their land. The Western Australian Organisms List contains information on the area(s) in which a pest is declared and the control and keeping categories to which it has be assigned in Western Australia.

Environmental Weeds

The Weed Prioritisation Process for the Department of Parks and Wildlife (Parks and Wildlife) prioritise weeds in each Parks and Wildlife region. The process ranks weeds based on their invasiveness, ecological impact, potential and current distribution and the feasibility for control. Within each region, each weed species has been ranked by risk (Table 3) (Parks and Wildlife, 2013).

Table A.6: Weed species rankings (Parks and Wildlife, 2013).

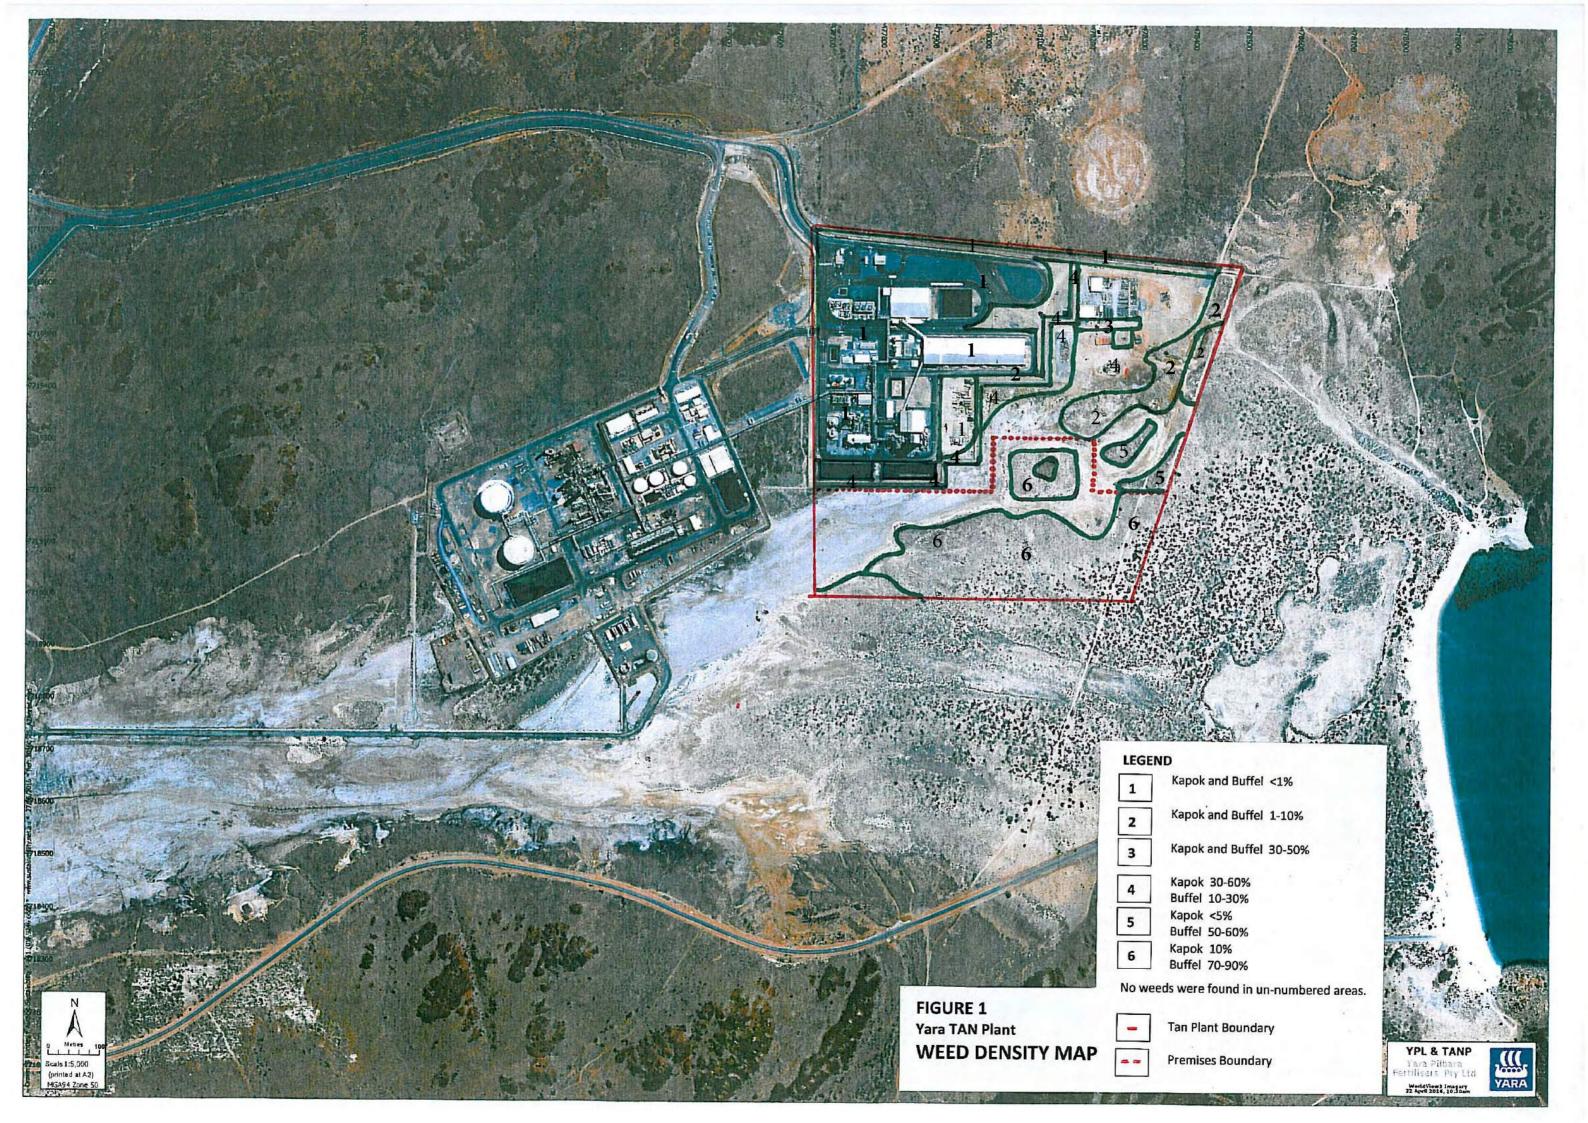

Weed Species Ranking	Objective
VH – Very High	Eradication
H - High	Eradication or control to reduce
M – Medium	Control to reduce or containment
L – Low	Containment at key sites only
N - Negligible	No action to be undertaken but may include monitoring only

The weed ranking includes examples of management actions that may be appropriate. Management actions that can be applied are presented in (Table 4) (Parks and Wildlife 2013).

Table A.7: Examples of management actions that may be considered for each ranking (Parks and Wildlife, 2013).

Management Code	Explanation
А	No action (the weed species ranking is so low as to not warrant any investment in regional strategic management actions)
В	Monitor only (aims to detect any significant changes in the species' weed risk or management ability)
С	Improve general weed management (aims to minimise weed impact and maintain the overall biodiversity, social, cultural and economic values on the region through improved general weed management
D	Protect priority sites (aims to prevent spread of weed species to key sites/assets of high biodiversity, social, cultural or economic value)
E	Targeted control to reduce infestations at priority sites (may include biocontrol) (aims to significantly reduce the impact of a weed species on key sites/assets of high biodiversity, social, cultural or economic value through targeted management)
F	Contain regional spread (aims to prevent the ongoing spread of the weed species in the region)
G	Reduce regional infestations (may include biocontrol) (aims to significantly reduce the extent of the weed species in the region)
Н	Regional eradication (aims to remove the weeds species from the region)
1	State-wide eradication (aims to remove the weed species from the State)

APPENDIX C Weed Map

2017 Compliance Assessment Report Ministerial Statement 870 Technical Ammonium Nitrate Plant

06-10-2017 600-200-CAR-YPN-0038 Rev 0

Attachment 8D.1

Letter to OEPA, dated 6 December 2016, notifying results of December 2016 Groundwater Monitoring Results.

6th December 2016

Our Reference: 200-200-LET-EPA-0010

Your Reference: 2013-0000239827:ST02-2013-004

Chief Executive Officer
Attention: Matt Spence, Senior Environmental Officer
Office of the Environmental Protection Authority
Locked Bag 10
East Perth WA 6892

Email: matt.spence@epa.wa.gov.au, compliance@epa.wa.gov.au

Dear Sir,

Subject: Report to OEPA for Groundwater Monitoring Results as per Condition 8 of Ministerial Statement No. 870

This letter is further to our letter of 1 September 2016 and to inform the OEPA on the outcomes of the latest groundwater monitoring undertaken by Yara Pilbara Nitrates Pty Ltd (YPN) at the Technical Ammonium Nitrate (TAN) plant as required by Conditions 8-4 and 8-5 of Ministerial Statement 870.

Condition 8-4 The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.

Condition 8-5 In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels: 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified; 2. The proponent shall provide evidence which allows determination of the cause of the exceedance; 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO; 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.

YPN has reported results to OEPA of previous monitoring regularly, as ongoing monitoring continues to show substantial variation that are considered to be reflective of a natural variability rather than a result of site related potential contamination sources as a result of ongoing construction activities.

Since our correspondence to the OEPA in September 2016, the following has occurred:

- An additional round of monitoring as undertaken on 1 and 3 September 2016 at MW1, MW2, MW3 and MW5. Key results are:
 - Total Nitrogen values at MW1 (12,000μg/L), MW5 (5,700μg/L) as well as MW2 (14,000μg/L) have exceeded the trigger value (5,610μg/L).
 - Total alkalinity value at MW3 (598mg/L) is slightly higher than the trigger value (561mg/L) and is within the range recorded at this bore since April 2015 (553-598mg/L)
- New sampling equipment has been procured and commissioned enabling sampling of MW4 to recommence.
- A scheduled 6-monthly round of monitoring of all monitoring wells was undertaken on 22 November 2016. Key results are:
 - Total Nitrogen values at MW1 (12,000μg/L), MW2 (12,000μg/L) MW5 (5,800μg/L) have exceeded the trigger value (5,610μg/L).
 - Total alkalinity value at MW3 (564mg/L) and MW5 (630mg/L) is slightly higher than the trigger value (561mg/L).
 - Total manganese value at MW4 (1.4mg/L) has exceeded the trigger value (0.242mg/L), but is lower than a previously recorded maximum in October 2014 (3.29mg/L).
- Investigation into potential sources of the elevated Total Nitrogen level is continuing. MW1 is at the upgradient side of plant site and samples groundwater that flows onto the TAN plant site. In accordance with Notice of Desktop Audit of Statement 870 (dated 21 November 2016) results of investigations will be provided to OEPA by 31 January 2017.

Attached to this letter is a summary table showing the 2016 groundwater monitoring results as well as the historical monitoring data, to enable a review of the variability of the parameters over time since 2011.

Yours Sincerely,

Brian HOWARTH

0304

2017 Compliance Assessment Report Ministerial Statement 870 Technical Ammonium Nitrate Plant

06-10-2017 600-200-CAR-YPN-0038 Rev 0

Attachment 8E.1

Letter to OEPA, dated 3 April 2017, notifying results of March 2017 Groundwater Monitoring Results

3 April 2017

Chief Executive Officer
Attention: Matt Spence, Senior Environmental Officer
Office of the Environmental Protection Authority
Locked Bag 10
East Perth WA 6892

Email: matt.spence@epa.wa.gov.au, compliance@epa.wa.gov.au

Dear Sir,

Subject: Report to OEPA for Groundwater Monitoring Results as per Condition 8 of Ministerial Statement No. 870

This letter is further to our letters of 6 December 2016 and 30 January 2017 and to inform the OEPA on the outcomes of the latest groundwater monitoring undertaken by Yara Pilbara Nitrates Pty Ltd (YPN) at the Technical Ammonium Nitrate (TAN) plant as required by Conditions 8-4 and 8-5 of Ministerial Statement 870.

Condition 8-4 The proponent shall sample/monitor all groundwater bores required by Condition 8-3 every six months and shall set groundwater monitoring trigger values at a value of 10% above the baseline contaminant concentrations obtained from the hydrogeological studies required by condition 8-1.

Condition 8-5 In the event that monitoring required by condition 8-4 indicates an exceedance of trigger levels: 1. The proponent shall report such findings to the CEO within 7 days of the exceedance being identified; 2. The proponent shall provide evidence which allows determination of the cause of the exceedance; 3. If determined by the CEO to be project attributable, the proponent shall submit actions to be taken to address the exceedance within 7 days of the determination being made to the CEO; 4. The proponent shall implement actions to address the exceedance and shall continue until such time as the CEO determines that the remedial actions may cease; and 5. The proponent shall submit bi-annually, or at a frequency defined to the satisfaction of the CEO, the results of monitoring required by condition 8-4 to the CEO, until such time as the CEO determines that reporting may cease.

YPN has reported results to OEPA of previous monitoring regularly, as ongoing monitoring continues to show substantial variation that are considered to be reflective of a natural variability rather than a result of site related potential contamination sources as a result of ongoing construction activities.

Since our correspondence to the OEPA, the following has occurred:

- A scheduled 6-monthly round of monitoring of all monitoring wells was undertaken on 15 March 2017 and laboratory results obtained on 24 March 2017. For nitrogen analytes that exceed trigger values an analysis of the same sample repeated by the analysing laboratory to confirm validity of measurements. Where repeated analyses produced different results, both results are listed below. Groundwater results for parameters that exceeded trigger values are:
 - \circ Total Nitrogen values at MW2 (12,000 μg/L), MW3 (6,600 μg/L, 6,300 μg/L), MW4 (58,000μg/L) and MW5 (9,400 μg/L, 9000 μg/L) exceeded the trigger value (5,610μg/L).
 - Nitrate (as NO3-) values at MW2 (12 mg/L), MW4 (55 mg/L) has exceeded the trigger value (9.57 mg/L).
 - Alkalinity (total) as CaCO3 at MW3 (591 mg/L) and MW5 (628 mg/L) was higher than the trigger value (561mg/L).
 - o Ammonia as N at MW4 (220 μ g/L, 250 μ g/L) was higher than the trigger value of 40 μ g/L.
 - Manganese (filtered) at MW4 (0.28 mg/L) exceeded the trigger value of 0.242 mg/L.
- Additional monitoring was undertaken on 22 March 2017 at MW4. Results are pending.
- Three additional upstream groundwater monitoring wells will be installed 2 April 2017.
 Monitoring of these will commence within 2 weeks of installation.
- On the 6 March a spill of solution which contained ammonium nitrate occurred at the TAN Plant. This event was associated with an unplanned shutdown event at both the Ammonia and TAN Plants. An investigation into the incident has been completed and the report is in the process of being finalised. The event has been reported to the Department of Environmental Regulation (DER) as a potential pollution event under Section 72 of the Environmental Protection Act. Yara will provide an investigation report to the DER and can provide a report to the OEPA upon request.

Attached is a summary table of the groundwater monitoring results as well as the historical monitoring data, to enable a review of the variability of the parameters over time since 2011.

Yours Sincerely,

Brian HOWARTH

HESQ Manager

1 INTRODUCTION

Environmental Resources Management Australia Pty Ltd (ERM) was commissioned by Burrup Nitrates Pty Ltd (BNPL) in 2008 to undertake a preliminary acid sulfate soil (ASS) investigation of the proposed Technical Ammonia Nitrate Production Facility (TANPF), located at "Site D" within the Burrup Industrial Estate (BIE) on the Burrup Peninsula, Western Australia (WA) (Figure 1, Annex A).

The ASS investigation undertaken focused on the 35 ha northern portion of Site D (hereafter referred to as 'the site') which is the designated area of disturbance (both permanent and temporary) for the TANPF (*Figure 1, Annex A*).

The preliminary ASS investigation is one of several baseline studies required in support of the environmental approvals process for the project.

1.1 PROJECT APPRECIATION

Site D occupies an area of approximately 79 ha and extends from Village Road in the north to Hearson Cove Road in the south. The existing Burrup Fertiliser Pty Ltd (BFPL) ammonia plant is situated adjacent the western boundary of Site D, with vacant land present between the site and Hearson Cove to the east.

The site (including temporary laydown areas) occupies approximately 35 ha in the northern section of Site D, albeit bulk earthworks disturbance associated with construction of permanent works for the TANPF will be constrained to approximately 16 ha (*Figure 2, Annex A*) within the north-west quadrant of Site D.

The TANPF comprises construction of three major processing units, including a nitric acid plant, ammonium nitrate solutions plant and the technical ammonium nitrate (TAN) plant.

The proposed site preparation works for the TANPF are anticipated to include the following activities, which have the potential to directly or indirectly disturb ASS, should they exist within the site:

- Bulk earthworks, including excavations undertaken for building and plant foundations, utilities and other civil works;
- Dewatering and trenching (subject to detailed design requirements); and
- Installation of site drainage.

It is understood that proposed finished design levels will be attained via cut to fill earthworks. Existing site levels will be reduced in the northern section of the site (refer *Figure 2, Annex A*), which corresponds to the 'Negligible ASS Risk' mapped zone. Fill from the northern section of the site will be imported to the low-lying southern section of the site to make up site levels. By implication, soil and groundwater disturbance within the 'Moderate to High Risk' ASS mapped zone of the site will be minimised in accordance with WA Department of Environment and Conservation (DEC) recommendations for best practice management of ASS. It is understood that the site will be filled to achieve a typical formation level of 5.5 m AHD (Golder, 2011). The interrelationship of the indicative earthworks cut and fill areas and ASS risk mapping zones are shown on *Figure 2, Annex A*.

1.2 OBJECTIVES

The principal objectives of the investigation were to establish, in a manner consistent with relevant DEC ASS guidance, an understanding of the acid sulfate soil status of the site, and associated potential environmental risk implications or constraints to the proposed development.

1.3 Scope Of Work

To meet the project objective, the following scope of works was completed in accordance with the approved proposal:

- A desktop assessment and site walkover inspection completed and reported as part of the approved Public Environmental Review (PER) (ERM, 2010);
- A soil and groundwater sampling and analysis program (SAP) was
 designed cognisant of the desktop assessment findings and relevant DEC
 guidance. The intrusive works comprised drilling of 10 soil bores across
 the site to a nominal target depth of 3m. At 5 locations, boreholes were
 extended at least 2m beyond the groundwater table to facilitate
 monitoring well installation and groundwater sampling and analysis;
- Soil samples were collected at regular depth intervals, field tested and submitted to SGS, a National Association of Testing Authorities (NATA) accredited laboratory for pH_{field} and pH_{fox}.
- Selected soil samples were analysed for the Chromium Reducible Sulphur (CRS) suite, guided by the outcomes of the afore-mentioned field pH testing;

- A single groundwater monitoring event was completed in April 2011, including recovery of representative groundwater samples from the 5 monitoring wells, field analysis of indicator parameters, and laboratory analysis of water quality parameters (including ASS indicator species); and
- Comparison of field and laboratory soil and groundwater data with relevant DEC ASS assessment criteria, to confirm the presence or absence of Actual Acid Sulfate Soils (AASS) and Potential Acid Sulfate Soils (PASS) and associated management implications (where applicable).

1.4 REGULATORY CONTEXT

Requirements for the assessment and management of ASS at the site were formally conditioned in Ministerial Statement No. 870 published on 7 July 2011. Condition 9 of the ministerial approval articulates the following requirements, which must be implemented pursuant to the provisions of the WA *Environmental Protection Act 1986* in support of the construction of the TANPF:

- 9 Acid Sulfate Soils
- 9-1 The proponent shall undertake intrusive acid sulfate soils investigations prior to the commencement of construction; and
- 9-2 In the event that acid sulfate soils are disturbed during construction of the TANPF, the proponent shall treat and manage acid sulfate soils in accordance with the requirements of the DEC's draft guideline on the treatment and management of acid sulfate soils and water in acid sulfate soil landscapes (May, 2009) and any subsequent revisions.

The findings of the ASS investigation conducted by ERM, as reported herein, may be used in support of the discharge of Ministerial condition 9-1 in due course. Informal consultation with the DEC in August 2011 (pers. comms Steve Appleyard) suggests that potential requirements for further intrusive investigation of the site may not be required on the basis of ERM's assessment results, which suggest a low-risk implication to future construction of the TANPF.

1.5 LIMITATIONS

The findings of this report are based on the scope of work outlined above. ERM performed the services in a manner consistent with the normal level of care and expertise exercised by members of the environmental assessment profession. No warranties, express or implied, are made. Although normal standards of professional practice have been applied, the absence of any identified hazardous or toxic materials on the subject Site should not be interpreted as a guarantee that such materials do not exist on the site.

This assessment is based on a site inspection conducted by ERM personnel, sampling and analyses described in the report, and information provided by people with knowledge of site conditions. All conclusions and recommendations made in the preliminary report are the professional opinions of the ERM personnel involved with the project and, while normal checking of the accuracy of data has been conducted, ERM assumes no responsibility or liability for errors in data obtained from regulatory agencies or any other external sources, nor from occurrences outside the scope of this project.

ERM is not engaged in environmental assessment and reporting for the purpose of advertising sales promoting, or endorsement of any client interests, including raising investment capital, recommending investment decisions, or other publicity purposes. The client acknowledges that this report is for the exclusive use of the client, its representatives and advisors and any investors, lenders, underwriters and financiers who agree to execute a reliance, and the client agrees that ERM's report or correspondences will not be, except as set forth herein, used or reproduced in full or in parts for such promotional purposes, and may not be used or relied upon in any prospectus or offering circular.

This report has been prepared solely for use by the client and ERM accepts no responsibility for its use by other parties.

2 METHODOLOGY

2.1 DESKTOP INVESTIGATION

DEC guidelines were followed to assess the presence of AASS and/or PASS at the site prior to undertaking the preliminary soil and groundwater investigations. The initial desktop assessment (ERM, 2010) included a review of:

- Western Australian Planning Commission (WAPC) ASS risk maps;
- Geological and hydrogeological mapping data;
- Topographical data;
- Geomorphological information;
- Available historical exploratory logs to assess soil stratigraphic units across the site; and
- Available field survey data to assess the presence of potential visual indicators of AASS/PASS, such as acid scalded areas, stunted or dead vegetation, acid tolerant vegetation, (black) iron monosulfides or (yellow) jarosite minerals.

The findings of the desktop assessment are presented in the published PER (ERM, 2010), including relevant baseline data pertaining to the site's history, surrounding land-uses, environmental setting, geological and hydrogeological conditions.

On the basis of the desk-based review findings, as reported in the PER (ERM, 2010), a site investigation was recommended to assess the presence and distribution of AASS and/or PASS.

2.2 FIELD INVESTIGATION

2.2.1 Soil Investigation Design Rationale

DEC guidance (DEC, May 2009) generally recommends a minimum of 2 sampling locations per hectare for non-linear disturbances over 4ha in size, which equates to nominally 32 sampling locations for the proposed TANPF development area.

However, upon review of available geological information, desktop data and walkover findings, a reduced density sampling program was considered satisfactory to characterise the distribution and magnitude of ASS at the site. The sampling design comprised 10 soil bores spatially distributed to investigate the inferred ASS risk zones associated with the principal geological/geomorphological units in the locality of the site, and cognisant of the proposed cut and fill design for the construction area.

2.2.2 Soil Investigation Rationale

The main soil investigation was undertaken in January 2011 by ERM and BNPL's nominated drilling subcontractor, Golder. All soil bores were drilled to at least 3 m below ground level (mbgl), which is inferred to be at least 0.5 m below the maximum intended depth of excavations within granular soils beneath the proposed TANPF footprint. Five of the bores were drilled beyond the permanent watertable to a maximum recorded depth of 9 mbgl to accommodate groundwater monitoring well installations. Investigation locations (SB1 – SB5 and MW1 – MW5) are illustrated on *Figure 2*, *Annex A*.

During drilling, soil lithology was logged by experienced ERM field personnel using the Unified Soil Classification System (USCS). Potential visual and olfactory indicators associated with acid sulfate soils were recorded where apparent (e.g. soil colour, mottling, hydrogen sulphide odours).

Soil samples were collected at 0.25 m intervals by the field investigator using a fresh pair of nitrile gloves for each sample. Samples were placed in laboratory supplied plastic bags and frozen prior to transport to SGS (a National Association of Testing Authorities (NATA) accredited laboratory) under strict chain of custody protocols.

Field screening (pH $_{\rm f}$ and pH $_{\rm fox}$) was undertaken by SGS consistent with guidance provided in the DEC's *Identification and Investigation of Acid Sulfate Soils and Groundwater* (May, 2009). Twenty-four soil samples were selectively analysed by SGS for the chromium reducible sulphur suite to assist with the confirmation of PASS and/or AASS at the site. These were selected according to field screening observations and to ensure representative lateral and vertical characterisation over the site.

2.2.3 Groundwater Investigation

A groundwater sampling program was conducted in April 2011 by trained ERM staff.

Standing water levels were gauged and representative samples recovered for field testing of indicator parameters (including temperature, pH, oxygen reduction potential, electrical conductivity and dissolved oxygen).

Representative groundwater samples were collected from the five groundwater monitoring wells (illustrated in *Figure 2, Annex A*) and submitted to SGS for analysis of ASS indicator species such as dissolved iron, aluminium and manganese, as well as baseline characterisation of major cations and anions, total dissolved solids, total hardness, total alkalinity and other dissolved metals.

3 RESULTS

3.1 DESKTOP INVESTIGATION

The desktop ASS assessment for the site is presented in full in the Public Environmental Review (ERM, 2010), which concluded that further investigation should be conducted to characterise the presence, distribution and magnitude of ASS at the site.

Western Australian 1:50,000 Urban Geology Series mapping for the site and surrounding area is indicated on *Figure 3, Annex A*. Mapping indicates that the on-site superficial geology comprises the following lithologies:

- Pleistocene red-brown silty sands (Qps) in the north-west section of the site, inferred to extend up to a maximum thickness of 10m;
- Holocene beach and dune shelly sands (Qhy) in the central section of the site, inferred to extend up to a maximum thickness of 10m; and
- Holocene mud and silt deposits (Qhm) in the southern section of the site (inferred to extend up to a maximum thickness of 5m).

The Holocene deposits are associated with the 'Moderate to High' ASS risk categorised section of the site (refer *Figure 2, Annex A*), which will undergo minimal direct and indirect disturbance according to the current earthworks design proposals. The Pleistocene soils in the northern section of the site, corresponding to the 'Low' ASS risk zone, will form the bulk of material disturbed during the construction works. The bedrock geology beneath the site comprises Granophyre, which does not present a potential ASS risk.

Several indicators suggestive of the presence of ASS were identified during the walkover inspection of the site, including waterlogged soils, iron staining in near-surface soil horizons, the presence of acid and water tolerant vegetation, and low lying bare/scalded areas. Shell fragments and other aquatic artefacts were also observed in the southern section of the site. There was also evidence of surface salt crusting on the ground in the southern portion of the site, and in historical surface water channels.

3.2 FIELD INVESTIGATION

3.2.1 Geological Findings

Exploratory logs from the investigation are presented in *Annex B* and summarised lithological details and ASS screening results are detailed in *Annex C, Table 1*.

The superficial soils at the site variably comprise brown to red-brown clayey sands, silty sands, clayey gravels and clayey gravelly sands, extending from ground level to between 0.5 and 5 m bgl. Shell grit inclusions were identified at some locations, consistent with the mapped geology.

Superficial soil thickness typically increases towards the southern margins of the site, consistent with geological and topographical expectations. Exploratory hole data did not reveal a distinct difference in soil type association between the 'Moderate to High' and 'Negligible' risk ASS mapped areas of the site.

Horizons of well to very well cemented ferricrete or calcrete were identified within the superficial soils at several locations, between 0.1 and 1.5 m bgl (Golder, 2011). Golder (2011) also recorded dolerite at one borehole location, which was assessed for geotechnical purposes only (BH04).

The superficial soils are generally underlain by Granophyre bedrock, which consists of pale grey and dark grey, fine to medium sized crystals, which is distinctly weathered and generally becomes fresher with depth (Golder, 2011). The bedrock is reported as locally fractured along thin iron-stained quartz seams, generally of high to extremely high strength.

A generalised geological cross-section for the site area is presented in *Figure 4, Annex A*.

3.2.2 ASS Investigation Findings

Consistent with interpretative guidelines detailed in the DEC's *Acid Sulfate Soils Guideline Series – Identification and Investigation of Acid Sulfate Soils and Acidic Landscapes* (May, 2009), samples were considered to potentially represent actual acid sulfate soils when pH_f was less than four.

Samples may be considered to potentially represent PASS when:

- 1) pH_{fox} is less than 4; and/or
- 2) the change in pH is greater than 2 (where the resultant pH_{fox} is less than 4); and/or
- 3) there is a strong reaction following addition of hydrogen peroxide.

Field screening of fifty-nine soil samples revealed that soil pH_f values ranged between 5.8 and 9.8 and were not indicative of AASS.

 pH_{fox} values ranged between 5.6 and 10.7 and the average difference between pH_f and pH_{fox} was generally less than 1. Five samples, SB5_0.0, SB5_0.5, MW2_0.0, MW3_0.0, MW5_1.0, had a difference between pH_f and pH_{fox} slightly greater than 2. Given the absolute pH_f and pH_{fox} values for these samples, it is considered unlikely that the results are indicative of PASS.

Observed reactions between soil and hydrogen peroxide ranged from slight to extreme intensity. It was noted that reaction intensity did not always correlate to the difference between pH_f and pH_{fox} . The observed extreme reactions (in the absence of sulphidic oxidation processes) may, however, be attributable to elevated manganese content in on-site soils (DEC, May 2009). Based on the overall field observations, the presence of AASS and PASS was considered unlikely.

Confirmatory laboratory analysis via the CRS suite, revealed that no samples contained reduced inorganic sulphur concentrations above the applicable DEC threshold criterion of 0.03%S for coarse textured sands and loamy sands (DEC, May 2009). Additionally, the pH KCl and actual acidity tests (TAA) were not suggestive of the presence of AASS in any of the samples (i.e. all pH KCl results were above 4.5).

Laboratory analysis results for the soil investigation are presented in *Annex C, Table 1*. Chain of custody (CoC) documentation and laboratory data are presented in *Annex D*.

3.2.3 Groundwater Investigation Findings

Full details of the site-specific hydrogeological and hydrological investigation findings for the site are presented in the report *Technical Ammonium Nitrate Production Facility Hydrogeological and Hydrological Investigation* (ERM, 2011).

Groundwater well sampling data forms are presented in *Annex B*.

Groundwater Elevation and Inferred Flow Direction

Groundwater elevations recorded in April 2011 are presented in *Annex C, Table 5*.

The recorded depth to groundwater at the site ranged between 0.566 to 2.926 m bgl. Groundwater elevations ranged between 2.166 m AHD at MW5 (in the southern section of the site) to 6.462 m AHD at MW1 (in the northern section of the site).

Groundwater data results indicate the presence of a continuous unconfined aquifer at the site, which is present at shallow depth in the Granophyre bedrock geology in the north of the site, and extends into the marine muds and silts in the low-lying southern section of the site. There is no evidence of secondary perched ground water at the site. Groundwater elevations are generally observed to follow surface topography at the site.

The interpolated groundwater flow direction is in a south easterly direction across the proposed development area, with an estimated hydraulic gradient of 0.011. The estimated groundwater contours for the site are shown in *Figure 5, Annex A*.

Groundwater Analytical Results

Annex C, Tables 2-5 provide a summary of field and laboratory groundwater analysis results.

Groundwater field pH measurements at the site ranged between 6.73 at MW5 and 7.65 at MW4, indicating circum-neutral groundwater conditions.

Redox results for those wells located in the northern section of the site (MW1-MW3) indicated slight to moderate reducing conditions (-100 to +57 mV), with the southernmost well results suggestive of oxidising groundwater conditions (+125 to 237 mV).

Recorded groundwater salinity increased from north (3,100-3,540 us/cm) to south (10-16,000 us/cm), which is consistent with the geological and geomorphological setting.

Dissolved iron (filtered) was identified at a concentration exceeding the laboratory limit of reporting (LOR) at MW1 only (0.008 mg/L). Dissolved aluminium (filtered) was recorded marginally above the laboratory LOR at monitoring wells MW1 and MW3 with concentrations of 0.01 and 0.013 mg/L recorded respectively. The observed concentrations of these ASS indicator species are not suggestive of associated impacts to the aquifer due to groundwater acidification.

Overall field and laboratory analysis results are not indicative of ASS impacts to groundwater in the locality of the site.

Chain of custody (CoC) documentation and laboratory data are presented in *Annex D*.

3.3 ANALYTICAL DATA QUALITY

Laboratory QA/QC procedures and results are detailed in the certified laboratory results contained in *Annex D*.

Analytical data quality checks were made to assess data in terms of completeness, representativeness, comparability, accuracy and precision.

All samples were collected, stored and transported to the laboratory in accordance with standard ERM protocols which are consistent with guidelines provided in the DEC's publication *Development of Sampling and Analysis Programs - Contaminated Sites Management Series* (DEC, 2001).

Laboratory analysis was undertaken within specified holding times in accordance with Schedule B(3) of the NEPM and using NATA accepted analytical procedures.

The overall field and laboratory QA/QC results indicate that the data is of sufficient quality to serve as a basis for interpretation in the assessment of ASS impacts to soil and groundwater at the site.

4 CONCLUSIONS

The ASS investigation results for the site do not indicate the presence of AASS/PASS within or adjacent to the proposed construction area.

Laboratory CRS results were all below the DEC threshold criterion of 0.03%S for coarse textured sands and loamy sands, which indicates that an Acid Sulfate Soils Management Plan (ASSMP) should not be required in support of construction of the facility, particularly in relation to earthworks and dewatering management requirements.

It is recommended that the findings of this investigation be formally reported in accordance with the latest DEC checklist requirements for a detailed ASS investigation and submitted for review and approval to discharge the ministerial conditions for the site.

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

Field pH for Acid Sulphate Soil Method: ME-(AU)-[ENV]AN104

Parameter	QC Reference	Units	LOR	MB	DUP %RPD
PHf	LB013150	pH Units	-	5.2 - 9.2	0 - 2%
PHfox	LB013150	pH Units	-	5.7 - 5.9	0 - 2%

METHOD SUMMARY

METHOD -

METHODOLOGY SUMMARY

AN104

pHF is determined on an extract of approximately 2g of as received sample in approximately 10 mL of deionised water with pH determined after standing 30 minutes.

AN104

pHFox is determined on an extract of approximately 2g of as received sample with a few mLs of 30% hydrogen peroxide (adjusted to pH 4.5 to 5.5) with the extract reaction being rated from slight to extreme, with pH determined after reaction is complete and extract has cooled. Referenced to ASS Laboratory Methods Guidelines, method 23Af-Bf, 2004.

QC result is above the upper tolerance

QC result is below the lower tolerance

The sample was not analysed for this analyte

FOOTNOTES .

IS Insufficient sample for analysis.

LNR Sample listed, but not received.

This analysis is not covered by the scope of accreditation.

^ Performed by outside laboratory.

LOR Limit of Reporting

 $\uparrow\downarrow$ Raised or Lowered Limit of Reporting

Samples analysed as received.

Solid samples expressed on a dry weight basis.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

Address

All the laboratory data for each environmental matrix was compared to the SGS Environmental Services' stated data quality objectives (DQO).

Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the chain of custody document and was supplied by the client.

This QA/QC statement must be read in conjunction with the referenced analytical report.

The statement and the analytical report must not be reproduced except in full.

All Data Quality Objectives were met.

HOLDING TIME SUMMARY

HOLDING TIMES

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in **Bold** with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

HOLDING TIMES

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

27/01/2011 Page 3 of 10

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Surrogates were required for this job.

27/01/2011 Page 4 of 10

METHOD BLANKS

Blank results are evaluated against the limit of reporting (LOR), for the chosen method and its associated instrumentation, which is typically 2.5 times the statistically determined method detection limit (MDL).

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

27/01/2011 Page 7 of 10

LABORATORY CONTROL STANDARDS

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report.

Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No LCS were required for this job.

27/01/2011 Page 8 of 10

QUALITY CONTROL - MATRIX SPIKES

Matrix spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report. Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spikes were required for this job.

27/01/2011 Page 9 of 10

MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as relative percent difference using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean
The original result is the analyte concentration of the matrix spike and the replicate result is the analyte concentration of the matrix spike duplicate.
The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spike Duplicates were required for this job.

FOOTNOTES

IS Insufficient sample for analysis. LNR Sample listed, but not received.

NATA Accreditation does not cover this analysis.

^ Performed by outside laboratory.

LOR Limit of Reporting

QFH QC result is above the upper tolerance
QFL QC result is below the lower tolerance
NA The sample was not analysed for this analyte

Samples analysed as received. Solid samples expressed on a dry weight basis.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

COMMENTS

The document is issued in accordance with NATA's accreditation requirements.

Accredited for compliance with ISO/IEC 17025. NATA accredited laboratory 2562(898/20210).

Liming rate calculated using a Fineness factor of 1.5 (which is equivalent to finely divided Ag Lime <0.5mm) and Neutralising Value (NV) of 100%.

If using Liming Material <100% NV, then Liming Rate can be adusted as follows:
Actual Liming Rate equals Calculated Liming Rate times 100 divided by NV of
actual Liming Material Bulk Density of Material of 1g/cm3 assumed.

If Bulk Density differs from 1g/cm3 then Liming rate can be adjusted as follows: Actual Liming Rate equals Calculated Liming Rate times Actual Bulk Density

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

METHOD SUMMARY

METHOD -

METHODOLOGY SUMMARY

AN004

AN214

Soils, sediments and sludges are pulverised using an LM2 ringmill. The dry sample is pulverised to a particle size of >90% passing through a -75µm sieve.

Acid Neutralising Capacity (ANC): The crushed or as received sample is reacted with excess normal acid (HCI)

and then back titrated with standard sodium hydroxide to determine the acid consumed. The result is expressed

QC result is above the upper tolerance

QC result is below the lower tolerance

The sample was not analysed for this analyte

as kg H2SO4/tonne

FOOTNOTES _

IS Insufficient sample for analysis.

LNR Sample listed, but not received.

* This analysis is not covered by the scope of accreditation.

^ Performed by outside laboratory.

LOR Limit of Reporting

 $\uparrow\downarrow$ Raised or Lowered Limit of Reporting

Samples analysed as received.

Solid samples expressed on a dry weight basis.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

Address

All the laboratory data for each environmental matrix was compared to the SGS Environmental Services' stated data quality objectives (DQO).

Comments arising from the comparison were made and are reported below.

The data relating to sampling was taken from the chain of custody document and was supplied by the client.

This QA/QC statement must be read in conjunction with the referenced analytical report.

The statement and the analytical report must not be reproduced except in full.

All Data Quality Objectives were met.

HOLDING TIME SUMMARY

HOLDING TIMES

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

HOLDING TIMES

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

SURROGATES

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Surrogates were required for this job.

8/02/2011 Page 4 of 10

Blank results are evaluated against the limit of reporting (LOR), for the chosen method and its associated instrumentation, which is typically 2.5 times the statistically determined method detection limit (MDL).

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

RPD %

PE055190A.036-DUP

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Sample Name

Original Result

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

LABORATORY CONTROL STANDARDS

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report.

Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

QUALITY CONTROL - MATRIX SPIKES

Matrix spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report. Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spikes were required for this job.

8/02/2011 Page 9 of 10

MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as relative percent difference using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean
The original result is the analyte concentration of the matrix spike and the replicate result is the analyte concentration of the matrix spike duplicate.
The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability
RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spike Duplicates were required for this job.

FOOTNOTES

IS Insufficient sample for analysis. LNR Sample listed, but not received.

NATA Accreditation does not cover this analysis.

^ Performed by outside laboratory.

LOR Limit of Reporting

QFH QC result is above the upper tolerance
QFL QC result is below the lower tolerance
NA The sample was not analysed for this analyte

Samples analysed as received. Solid samples expressed on a dry weight basis.

The QC criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: http://www.au.sgs.com/sgs-mp-au-env-qu-022-qa-qc-plan-en-09.pdf

This document is issued, on the Client's behalf, by the Company under its General Conditions of Service available on request and accessible at http://www.sgs.com/terms_and_conditions.htm. The Client's attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Any other holder of this document is advised that information contained hereon reflects the Company's findings at the time of its intervention only and within the limits of Client's instructions, if any. The Company's sole responsibility is to its Client and this document does not exonerate parties to a transaction from exercising all their rights and obligations under the transaction documents.

The document is issued in accordance with NATA's accreditation requirements.

Accredited for compliance with ISO/IEC 17025. NATA accredited laboratory 2562(898/20210).

Samples `MW3', `MW4' and 'MW5' were diluted due to high conductivity for metals. Hence the LORs were raised for these samples.

Samples received outside recommended technical holding times for Alkalinity and Hexavalent Chromium.

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

Alkalinity Method: ME-(AU)-[ENV]AN135

Parameter	QC Reference	Units	LOR	MB	DUP %RPD	LCS %Recovery
Total Alkalinity as CaCO3	LB018729	mg/L	5	<5	0 - 3%	110%
Carbonate Alkalinity as CO3	LB018729	mg/L	1	<1

QC SUMMARY

MB blank results are compared to the Limit of Reporting

LCS and MS spike recoveries are measured as the percentage of analyte recovered from the sample compared the the amount of analyte spiked into the sample.

DUP and MSD relative percent differences are measured against their original counterpart samples according to the formula: the absolute difference of the two results divided by the average of the two results as a percentage. Where the DUP RPD is 'NA', the results are less than the LOR and thus the RPD is not applicable.

METHOD SUMMARY

METHOD	
AN020	METHODOLOGY SUMMARY Unpreserved water sample is filtered through a 0.45µm membrane filter and acidified with nitric acid similar to
	APHA3030B.
AN075	This method uses an alkaline digestion to solubilise both water-soluble and waterinsoluble forms of hexavalent chromium in solids. The solution is then pH adjusted and the hexavalent chromium concentration in solution
	determined colourimetrically. Please refer to method AN283. The addition of magnesium chloride in a phosphate buffer at the digestion stage assists with preventing oxidation of trivalent chromium to hexavalent chromium.
AN083	Separatory funnels are used for aqueous samples and extracted by transferring an appropriate volume (mass) of
	liquid into a separatory funnel and adding 3 serial aliquots of dichloromethane. Samples receive a single extraction at pH 7 to recover base / neutral analytes and two extractions at pH < 2 to recover acidic analytes. QC samples are prepared by spiking organic free water with target analytes and extracting as per samples.
AN113	Total Dissolved Solids: A well-mixed filtered sample of known volume is evaporated to dryness at 180°C and the residue weighed. Approximate methods for correlating chemical analysis with dissolved solids are available.
	Reference APHA 2540 C.
AN121	This method is used to calculation the balance of major Anions and Cations in water samples and converts major ion concentration to milliequivalents and then summed. Anions sum and Cation sum is calculated as a difference and expressed as a percentage.
AN135	Alkalinity (and forms of) by Titration: The sample is titrated with standard acid to pH 8.3 (P titre) and pH 4.5 (T titre)
	and permanent and/or total alkalinity calculated. The results are expressed as equivalents of calcium carbonate or recalculated as bicarbonate, carbonate and hydroxide. Reference APHA 2320. Internal Reference AN135
AN149	Sulphide by lodometric Titration: Sulphide is precipitated as zinc sulphide to overcome interferences with sulphite and thiosulphate. After filtration, sulphide is determined titrimetrically. Reference APHA 4500-S2-
	and unlosulphate. After initiation, sulphide is determined utilinetrically. Reference AFTIA 4500-52-
AN258	Nitrate and Nitrite by FIA: In an acidic medium, nitrate is reduced quantitatively to nitrite by cadmium metal. This nitrite plus any original nitrite is determined as an intense red-pink azo dye at 540 nm following diazotisation with sulphanilamide and subsequent coupling with N-(1-naphthyl) ethylenediamine dihydrochloride. Without the
	cadmium reduction only the original nitrite is determined. Reference APHA 4500-NO3- F.
AN261	Ammonia by Continuous Flow Analyser: Ammonium in a basic medium forms ammonia gas, which is separated from the sample matrix by diffusion through a polypropylene membrane. The ammonia is reacted with phenol
	and hypochlorite to form indophenol blue at an intensity proportional to the ammonia concentration. The blue colour is intensified with sodium nitroprusside and the absorbance measured at 630 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-NH3 H.
ANI074	
AN274	Chloride by Aquakem DA: Chloride reacts with mercuric thiocyanate forming a mercuric chloride complex. In the presence of ferric iron, highly coloured ferric thiocyanate is formed which is proportional to the chloride concentration. Reference APHA 4500CI-
AN275	Suphate by Aquakem DA: Sulphate is precipitated in an acidic medium with barium chloride. The resulting turbidity
	is measured photometrically at 405nm and compared with standard calibration solutions to determine the sulphate concentration in the sample. Reference APHA 4500-SO42 Internal reference AN275.
AN278	Reactive Phosphorus by Aquakem DA: Orthophosphate reacts with ammonium molybdate (Mo VI) and potassium antimonyl tartrate (Sb III) in acid medium to form an antimony-phosphomolybdate complex. This complex is
	subsequently reduced with ascorbic acid to form a blue colour and the absorbance is read at 880 nm. The sensitivity of the automated method is 10-20 times that of the macro method. Reference APHA 4500-P F
AN279/AN293	The sample is digested with Sulphuric acid, K2SO4 and CuSO4. All forms of phosphorus are converted into

Page 8 of 10 17-May-2011

orthophosphate. The digest is cooled and placed on the Aquakem 250 discrete analyser for colorimetric analysis.

METHOD SUMMARY

METHOD	
METHOD	METHODOLOGY SUMMARY
AN283	Hexavalent Chromium via Aquakem DA: Soluble hexavalent chromium forms a red/violet colour with diphenylcarbazide in acidic solution. This procedure is very sensitive and nearly specific for Cr6+. If total chromium is also measured the trivalent form of chromium Cr3+ can be calculated from the difference (Total Cr - Cr6+). Reference APHA3500CrB.
AN288	Digestion of the sample to convert amino nitrogen present in many organic materials to ammonium sulphate. Free ammonia and ammonium nitrogen also are converted to ammonium sulphate. Colorimetric determination of ammonium nitrogen using the Phenate-Hypochlorite Method (APHA, 2005). Ammonia, phenol and hypochlorite react in an alkaline buffered medium to form a blue coloured compound, indophenol. This reaction is catalysed by sodium nitroprusside. The intensity of the colour development is directly proportional to the concentration of ammonia-nitrogen.
AN311/AN312	Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500.
AN318	Determination of elements at trace level in waters by ICP-MS technique, in accordance with USEPA 6020A.
AN320/AN321	Metals by ICP-OES: Samples are preserved with 10% nitric acid for a wide range of metals and some non-metals. This solution is measured by Inductively Coupled Plasma. Solutions are aspirated into an argon plasma at 8000-10000K and emit characteristic energy or light as a result of electron transitions through unique energy levels. The emitted light is focused onto a diffraction grating where it is separated into components.
AN320/AN321	Photomultipliers or CCDs are used to measure the light intensity at specific wavelengths. This intensity is directly proportional to concentration. Corrections are required to compensate for spectral overlap between elements. Reference APHA 3120 B.
AN403	Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36.
AN403	Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Petroleum Hydrocarbons (TPH) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with diffential polarity of the elluent solvents.
AN403	The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependant on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.
AN433/AN434	VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

HOLDING TIME SUMMARY

HOLDING TIMES

SGS holding time criteria are drawn from current regulations and are highly dependent on sample container preservation as specified in the SGS "Field sampling guide for containers and holding time" (Ref: GU-(AU)-ENV.001). Soil samples guidelines are derived from NEPM "Schedule B(3) Guideline on Laboratory Analysis of Potentially Contaminated Soils". Water sample guidelines are derived from "AS/NZS 5667.1: 1998 Water Quality - sampling part 1" and APHA "Standard Methods for the Examination of Water and Wastewater" 21st edition 2005.

The extraction and analysis holding time due dates listed are calculated from the date sampled, although holding times may be extended after laboratory extraction for some analytes. The due dates are the suggested dates that samples may be held before extraction or analysis and still be considered valid.

Extraction and Analysis dates are shown in Green when within suggested criteria and in Bold with an appended dagger symbol and Red† when outside suggested criteria. If the sampled date is not supplied then compliance with criteria cannot be determined. If the received date is after one or both due dates then holding time will fail by default.

Samples received outside recommended technical holding times for Alkalinity and Hexavalent Chromium.

17/05/2011 Page 4 of 18

Surrogate results are evaluated against upper and lower limit criteria established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). At least two of three routine level soil sample surrogate spike recoveries for BTEX/VOC are to be within 70-130% where control charts have not been developed and within the established control limits for charted surrogates. Matrix effects may void this as an acceptance criterion. Water sample surrogate spike recoveries are to be within 40-130%. The presence of emulsions, surfactants and particulates may void this as an acceptance criterion.

Result is shown in **Green** when within suggested criteria or **Bold** with an appended dagger symbol and Red† when outside suggested criteria.

METHOD BLANKS

Blank results are evaluated against the limit of reporting (LOR), for the chosen method and its associated instrumentation, which is typically 2.5 times the statistically determined method detection limit (MDL).

Result is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

DUPLICATES

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Sample Name

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

17/05/2011 Page 12 of 18

Duplicates are calculated as relative percent difference (RPD) using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean

The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability

Where the MaxAllowableDifference evaluates to a number larger than 200 it is displayed as 200.

RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

LABORATORY CONTROL STANDARDS

Laboratory Control Standard (LCS) results are evaluated against an expected result, typically the concentration of analyte spiked into the control during the sample preparation stage, producing a percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report.

Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

QUALITY CONTROL - MATRIX SPIKES

Matrix spike (MS) results are evaluated as the percentage recovery of an expected result, typically the concentration of analyte spiked into a field sub-sample during the sample preparation stage. The original sample's result is subtracted from the sub-sample result before determining the percentage recovery. The criteria applied to the percentage recovery is established in the SGS QA/QC plan (Ref: MP-(AU)-[ENV]QU-022). For more information refer to the footnotes in the concluding page of the report. Recovery is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

Recovery failed acceptance criteria due to the presence of significant concentration of analyte (i.e. the concentration of analyte exceeds the spike level).

17/05/2011 Page 17 of 18

MATRIX SPIKE DUPLICATES

Matrix spike duplicates are calculated as relative percent difference using the formula RPD = | OriginalResult - ReplicateResult | x 100 / Mean
The original result is the analyte concentration of the matrix spike and the replicate result is the analyte concentration of the matrix spike duplicate.
The RPD is evaluated against the maximum allowable RPD criteria and can be graphically represented by a curve calculated from the statistical detection limit and limiting repeatability using the formula: MaxAllowableDifference = 100 x StatisticalDetectionLimit / Mean + LimitingRepeatability
RPD is shown in Green when within suggested criteria or Bold with an appended dagger symbol and Red† when outside suggested criteria.

No Matrix Spike Duplicates were required for this job.

FOOTNOTES

IS Insufficient sample for analysis. LNR Sample listed, but not received.

NATA Accreditation does not cover this analysis.

Steve Morrison ERM Australia 6th Floor, 172 St Georges Terrace Perth WA 6000

Dear Mr Morrison,

TECHNICAL AMMONIUM NITRATE PRODUCTION FACILITY ACID SULFATE SOILS INVESTIGATION

Thank you for your submission of the report entitled "Burrup Nitrates Pty Ltd, Technical Ammonium Nitrate Production Facility (TANPF), Acid Sulfate Soils Investigation" (ERM Australia, December 2011) (the report) to the Contaminated Sites Branch (CSB) of the Department of Environment and Conservation (DEC). The report was received on 9 March 2012.

It is understood that the report was prepared to satisfy Condition No. 9 of Ministerial Statement 870 under Part IV of the *Environmental Protection Act 1986*, issued for Lots 3017 and 3018 Hearson Cove Road, Burrup Industrial Estate on 7 July 2011. Condition 9 reads as follows:

"9-1 The proponent shall undertake intrusive acid sulphate soils investigations prior to the commencement of construction.

9-2 In the event that acid sulphate soils are disturbed during construction of the TANPF, the proponent shall treat and manage acid sulphate soils in accordance with the requirements of the DEC's draft guideline on the treatment and management of acid sulfate soils and water in acid sulfate soil landscapes (DEC, 2009) and any subsequent revisions."

CSB has reviewed the report and provides the following comment.

Based on the information provided, CSB concurs with the results of the acid sulfate soil (ASS) investigation carried out at the site and agrees that no ASS appear to be present at the site.

It is understood that dewatering will be undertaken at the site, but that dewatering is not expected to disturb any ASS within the development area. Groundwater modelling was not provided, but soil investigations have also been undertaken in the surrounding area (in the most likely topographic area for ASS to be present) and these did not identify ASS. As such, CSB considers that dewatering is unlikely to disturb ASS and that groundwater modelling is not required.

As such, it is agreed that an acid sulfate soil and dewatering management plan (ASSDMP) is not necessary for the proposed works.

However, as total acidity was not included as an analyte in groundwater investigations, DEC recommends that the quality of dewatering effluent is monitored during any dewatering operations via measurements of pH (at a minimum) and total titratable acidity. These parameters can be measured in the field by dewatering contractors. If any deterioration in dewatering effluent quality is noted, this should be used as a trigger to implement contingency actions as described in section 5.3.7 of 'Treatment and management of soils and water in acid sulfate soil landscapes' (DEC, July 2011).

Ammonia, chromium and mercury were present in groundwater at concentrations exceeding the Aquatic Ecosystems – Marine guidelines, as published in 'Assessment Levels for Soil, Sediment and Water' (DEC, 2010). Dewatering effluent should not be discharged to the marine environment unless it can be shown to be of a suitable quality.

Should the site work program change such that excavation and/or dewatering is proposed to be undertaken outside the area shown in Figure 1, then further investigation and/or a comprehensive acid sulfate soil and dewatering management plan (ASSDMP) should be developed to the satisfaction of DEC.

Consequently, CSB considers that Condition No. 9 of Ministerial Statement 870 has been satisfactorily met for Lots 3017 and 3018 Hearson Cove Road, Burrup Industrial Estate.

Please contact Rowena Beaton, Environmental Officer of CSB, on 9333 7573 if you have any queries in relation to the above.

Yours sincerely

Kerry Laszig MANAGER

1 Purpose and Application

Yara Pilbara Nitrates Pty Ltd (YPNPL) submitted a development application for the proposed Technical Ammonium Nitrate Production Facility (TANPF) to the City of Karratha.

The implementation of the proposal is subject to a set of conditions defined by the Environmental Protection Authority (EPA) and set forth in Ministerial Statement 870. Condition 10-1 (870:M10.1) refers to decommissioning as an overall phase of the TAN Burrup Project execution and therefore requires a management plan.

The Decommissioning Environmental Management Plan (DEMP) is a dynamic document that:

- Will be periodically reviewed and revised throughout the decommissioning phase;
- · Will be reissued prior to the decommissioning phase; and
- Can be reissued at other intervals as required by HES.

Future submissions will include a summary of the effectiveness of the mitigation measures over the previous 12 months.

The issue of closing down, dismantling and demolishing the TANPF is an integral part of restructuring of YPNPL's business. The intention with this manual is to describe a best practice approach to the issue.

Information from several sources has therefore been combined into this manual. The document has, to a large extent, the form of a checklist. The document will be subject to changes and development to reflect the experience which will be gained.

More specific information will be found as enclosures to the document.

The site has been proposed and defined based different criteria including minimization of environmental disturbance (see section 5). The level of the site has been studied to ensure minimal alterations to original level. The site will be brought back to a level of an industrial zoned area. Relevant items for the final landform at closure to be considered:

- The requirement to think long term.
- The requirement to integrate the closure plan into current operations.

It is therefore essential to begin with determining the desired geometry at closure taking into consideration:

- The management of runoff and long term erosion;
- The slope profile that will generate minimum erosion;
- The potential effects of differential settlement; and
- Isolation of chemically adverse material within the dump such that it is unlikely to be exposed by erosion and that net infiltrated rainwater through the adverse material is minimized.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

The decommissioning phase will last approximately four to six months with an average manning level of at least 30-40 persons. The number of persons involved in these activities is susceptible to increase. Upon decommissioning the TANPF is not considered likely to have any significant hazardous wastes or contaminate land. All wastes and contaminated material will be cleaned and removed in accordance with relevant legislation and the DEMP.

The site will be brought back to a level of an industrial zoned area. The original landform has not been significantly altered and for areas/sections of the site that could potentially be differing significantly from the original landform, restoration shall be considered.

In addition equipment, buildings and other facilities will be removed. Decommissioning activities will involve the recovery of catalyst (platinum) from the heat exchangers and vessels in the NA plant.

Clean and contaminated surface water ponds will be emptied and cleaned (with all contaminated waste to be appropriately removed by an approved waste contractor), and all interconnections (piping) to the YPFPL site will be removed.

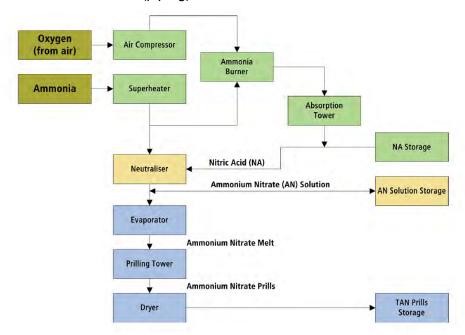

Figure 1: TAN Production Facility Production Process

11-05-2015 500-200-PLN-YPN-0001 Rev 6

This DEMP will indicate the mitigation measures to reduce and where possible prevent any significant adverse effects on the environment throughout the decommissioning phase of the Project. The decommissioning activity is divided into 3 phases as follows:

- Care and Maintenance Preparations: is the first phase of decommissioning. During this phase most of the plant and buildings on the site will be dismantled and cleared.
- 2. Care and Maintenance: is the second phase of decommissioning, during which no significant dismantling will be carried out. The Site will continue to be managed, monitored and maintained.
- 3. Final Site Clearance: is the last phase. This involves the dismantling of the remaining structures on the Site and the clearance of any residual to bring it back to a level of an industrial zone area.

Environmental topics to be considered as a minimum are:

- Air Quality and Dust
- · Archaeology and Cultural Heritage
- Ecology
- Geology, Hydrogeology and Soils
- Landscape and Visual
- Noise and Vibration
- Socio-Economic
- Surface Waters
- Traffic and Transport

Table 1 below summarizes the requirements given in Ministerial Statements 870, Condition 10-1

Requirements of Condition 10-1	. Description	
Condition part 10-1(1)	Describe the rationale for siting and design of plant and infrastructure as relevant to environmental protection	Section 5
Condition part 10-1(2)	Prepare a conceptual plan of the final landform at closure	Section 6
Condition part 10-1(3)	Prepare for plan for care and maintenance phase	Section 8.1.5
Condition part 10-1(4)	Prepare an initial plan for the management of noxious materials following closure.	Section 8.1.8

4 Rationale for Siting and Design of the Plant and Infrastructure Relevant to Environmental Protection

4.1 Site Selection

During the Site selection screening study, three industrial estates in the Pilbara region were assessed and ranked in terms of their suitability for development of a technical ammonium nitrate production facility (TANPF). The three industrial estates identified were:

- Mount Anketell Industrial Estate (MAIE) A 4,775 Ha industrial estate located on the Pilbara coastline in the northwest of WA, 1,253 km north of Perth and 37km northeast of Karratha and situated in the Shire of Roebourne.
- Burrup Industrial Estate (BIE) A 1,400 Ha strategic industrial estate located on the Burrup Peninsula, 13km northwest of Karratha.
- Maitland Industrial Estate (MIE) A 3,300 Ha strategic industrial estate located about 17 km southwest of Karratha

Criteria used in selecting one of the three industrial estates included, but was not limited to:

1. Access:

- Land tenure (current and historical)
- Suitably industrial zoned land
- Native title claims and their status
- Aboriginal heritage
- Year-round road access

2. Physical Environment:

- Environmental sensitivity
- Topography and geomorphology
- Existing infrastructure

3. Development Considerations:

- HES management factors
- Proximity and reliability of a suitable source of liquid ammonia
- Proximity and reliability of a natural gas supply
- Availability of services such as power and water
- Suitable for storage of technical ammonium nitrate
- Constructability and operability

11-05-2015 500-200-PLN-YPN-0001 Rev 6

- 4. Commercial and Marketing Issues:
 - Proximity of a community with the appropriate support facilities
 - Availability of skilled labour
 - Transport access/egress
 - Proximity to market
 - Public opinion

Following site selection studies of the MAIE, BIE and MIE, it was decided that site D within King Bay/Hearson Cove Industrial Precinct, part of the BIE, was the only suitable identified site for the TANPF project.

All locations within the BIE were considered utilizing the evaluation criteria that is outlined above. Site D was selected for several reasons, of which the main reason is the close proximity to the Yara Pilbara Fertilisers Pty Ltd Ammonia Plant (YPFPL) operating about 100 m to the west of the proposed Site. The YPFPL plant will provide the required quantity of ammonia as feed stock for the production of TAN and will allow for a reliable supply to ensure uninterrupted operations at the TANPF. The proximity to the ammonia plant will also allow the existing infrastructure and utilities.

Other reasons behind choosing to develop the proposed TANPF in the BIE include:

- The Site is already zones for strategic industrial use under the City of Karratha Town Planning Scheme no.8 – The King Bay/Hearson Cove Industrial Precinct is government endorsed (at state and local levels) as identified in the Burrup Peninsula Land Use Plan and Management Strategy (O'Brian Planning Consultants, 1996).
- Site D provides for a safe distance between the bulk storage at the proposed TANPF and ammonia storage tanks located at the YPFPL plant. In addition this location provides a safe distance from the Burrup Road, the main causeway road, and associated infrastructure (e.g. the Dampier to Bunbury Natural Gas Pipeline as well as Hearson Cove).
- Native Title being extinguished over the Site State government negotiated in 2003 a Native Title Agreement with the Native Title claimant groups of the Burrup Peninsula.
- Being compatible with adjacent industries The TANPF Project is compatible with adjacent industries and will utilize power, water and ammonia from existing industries/facilities within the BIE.
- Proximity to the market Within close proximity to numerous major mining operations in the Pilbara.
- Flat topography This means that it is feasible to construct the TANPF with reduced civil works, therefore reducing impacts associated with construction of the TANPF.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

- The Site is located in proximity to the existing available port facilities, allowing easy delivery of key plant components.
- The Site is serviced by existing trafficable roads allowing for easy access to the Site, as well as reducing the environmental impact and additional costs associated with a more isolated site.
- The proponent has a track record and extensive knowledge of operating in the BIE since the ammonia plant construction/operation commenced 10 years ago.
- All necessary infrastructure and services are already available for the project.
- Suitably qualified workforce is locally available Karratha (13km to the southeast) and Dampier (6km to the southwest) has developed a qualified and experienced workforce as a result of large-scale mineral and petroleum resource developments in the region. The majority of the existing workforce is employed in the resources industry including Hamersley Iron, Dampier salt, the North West Shelf Gas Project, Woodside's Pluto Gas Project and YPFPL's ammonia plant.

4.2 Plant Layout Selection

The layout and location of the TANPF within Site D was determined based on, but not limited to, the following key factors:

- 1. Aboriginal heritage:
 - YPNPL are intent on disturbing no rock art and minimizing any potential impacts on heritage sites
- 2. Environmental impacts including flora and fauna, topography, supra-tidal flats, site inundation by flooding or storm surge:
 - YPNPL have a corporate and social responsibility to minimize the impacts on the environment where possible.

3. Geotechnical

- To help determine the suitability of the ground and footings for the location of a TANPF.
- 4. Optimizing internal logistics and safety
 - Risk and safety impacts are to be minimized and are the main priority of YPNPL.

5. Site access

 Site access from Village Road is important to ensure disturbance to important cultural heritage and recreational activities of Deep Gorge and Hearson Cove were minimized.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6. Feedstock and infrastructure

 Location in close proximity to YPFPL plant which will be providing uninterrupted supplies of ammonia feedstock and utilities. Shared infrastructure will be provided by both YPFPL and the Water Corporation.

7. Impacts on surrounding land use and infrastructure

 Industry, cultural heritage sites and recreational areas are all key aspects of the Burrup Peninsula.

Based on the key factors mentioned above, the TANPF was located in the northern section of the Site. The selected location in the northwestern corner of the Site was determined based on numerous internal reviews and optimizes the positioning of the TANPF when taking into account the issued mentioned above. Key reasoning behind the decision is that the location:

- Provides the highest elevation above sea level on the Site to help avoid and mitigate any potential flooding or storm surge impacts from the low lying supra-tidal flats to the south
- 2. Is the furthest points from local from local sensitive receptors at Hearson Cove and Deep Gorge
- 3. Is in the optimal location from a safety standpoint, with risk contours all within the required ranges
- 4. Complies with WA government request that industries are positioned so as to enable optimal usage of all industrial estate land
- 5. Contains no identified threatened or priority flora, fauna habitats or threatened ecological communities
- 6. Is not within an area that will disturb any Aboriginal rock art
- 7. Is in an area of the Site, easily accessed from Village Road, avoiding access from the south via Hearson Cove Road.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

5 Conceptual Plan of Final Landform at Closure

In agreement with the Stakeholders as identified in the PER, the Site shall be returned to an industrial zoned area:

- All above ground building and structures shall be removed
- Underground piping and equipment shall be removed
- Foundations / underground civil works / roads shall be removed at least to a depth of 400 mm and backfilled
- All excavation shall be back filled

The Site will remain as a single terrace. Structures such as embankment and Channels on the periphery of the Site shall remain in place so that drainage is still possible.

The proposed landform at closure in illustrated in Attachment 3.

The Plant area will remain at an overall level of +5.5 and the northern and western channels will remain. Embankments will also remain.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6 Project Approach to Decommissioning

As a natural part of the life cycle of a fixed asset, the asset will have to be decommissioned and disposed of in a satisfactory manner when it is no longer feasible to operate.

When a fixed asset comes to this stage, a project approach shall be used. The reason for this is the uniqueness of the activities, taking into account amongst others the production processes, feed stock materials, buildings, equipment, location, local conditions and legislation.

The project approach implies that three phases need to be considered; identification, planning and execution phase.

6.1 Closure Scenarios and Closure Management Strategies

There are three scenarios under which the plant may cease operation:

- Planned final closure
 Occurs when operation ceases due to economic or operational requirements
- Unplanned closure
 Occurs when operations suddenly cease due to financial constraints or if the
 operations are instructed to close due to non-conformances with regulatory
 requirements
- Temporary closure
 Care and maintenance is often required for operations that have temporarily ceased operations. In this situation a "caretaker" generally manages the site and the operation may recommence when more positive circumstances prevail

Closure management strategies have been developed for the three closure scenarios and described in detailed in section 6.2.6.

Both unplanned and temporary closure only last for a limited period of time before a decision is made to either recommence or to cease operation and enter planned final closure. It is appropriate for strategies to be developed for the environmental risk aspects of the closure scenarios.

For planned final closure it is possible to target physical aspects of the plant and site and develop closure strategies. Should the plant enter either unplanned or temporary closure it may ultimately go through planned final closure and all the strategies relating to physical aspects of the plant and site will then be addressed.

6.2 Identification Phase

This is the first, early phase when closing, dismantling, demolition and disposal of production facilities are considered. The purpose of this phase is to identify the scope of all activities on an overall level as a basis for a total estimate. The activities and their associated cost elements can be grouped as follows:

- Legal and contractual obligations towards redundant personnel (transfer, dismissal or early retirement or other social cost)
- Operation during the closing down period:
 - Supervision
 - Utilities
 - Consumables
- Non fulfilment of contractual obligations to partners, covering:
 - Feed stock
 - Energy import and export
 - Product and by-product delivery
 - Land lease and common infrastructure
- Preparations for dismantling and demolition of equipment, buildings, off-sites and utilities:
 - Emptying and cleaning
 - Disposal of waste products
 - Disposal of catalyst, lubrication agents, contaminated or toxic material
- Dismantling and demolishing (above ground level):
 - Dismantling sellable or reusable equipment and materials
 - Preservation, storing and transportation of sellable or reusable equipment and materials
 - Demolishing and sorting of materials
 - Recycling and/or disposal of materials
- Dismantling and demolishing (below ground level):
 - Foundations
 - Piles
 - Sewage systems
 - Cables and pipelines
 - Recycling and/or disposal of materials
- Preparation for further use of the site:
 - · Replacement of contaminated soil
 - Rerouting of common infrastructure (cables, pipe racks, underground installations)
 - Ground levelling and final preparation

11-05-2015 500-200-PLN-YPN-0001 Rev 6

- Site cleaning
- Special HES issues:
 - Radiation/radioactivity
 - Possible less known contamination from previous activities at site
- Project management cost, including engineering and procurement activities during the dismantling and demolition phase.

Due to the sensitivity of such early phase work, only few persons will be involved in this phase. However, these shall be familiar with the local conditions and situation in order to cover as many aspects as possible. In this phase the accuracy of the estimate and schedule for activities will be on the lower side.

6.3 Planning Phase

When it has been decided that YPNPL (or part of it) shall be closed, dismantled and demolished, the activities can be split in two main groups:

- One dealing with personnel, the transition period from operation to standstill and contracts/agreements.
- The other group deals with the activities to prepare for and carry out dismantling, demolition, disposal and preparations for future use of the Site or area thereof.

This manual will deal with the latter.

6.3.1 Planning of dismantling, demolition, disposal and final preparation of the site

This is an important project phase because it will be the basis for a successful execution. It is to be compared to a pre-execution (main) study phase in a "normal" project. Competent personnel is essential, but especially when it comes to knowledge about the facility's history and the impact this may have on content of toxic, contaminated or polluting material in equipment, buildings and the ground.

The purpose of the study is to clarify all aspects relevant for estimating the cost and also to establish methods, philosophies and schedules for the execution phase. One aspect is also to optimise the cost by identifying the potential for income from sale of useful equipment and material, but also to reduce transportation, recycling and disposal cost e.g. by separation of material in contaminated and non-contaminated fractions.

6.3.2 Definition of the works

A clear description of the scope of work for the decommissioning and the objectives of it is an important basis also for this type of activities.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.3.3 Execution and procurement strategy

This has to be developed in the planning phase. It will be dependent on the project's scope and objective, but also on available personnel at YPNPL being closed.

An important factor is to survey the market for (demolishing and second hand equipment) contractors in order to choose the most suitable contract format and contractors for the actual scope. A prequalification is going to be made in order to short list contractors which can meet the requirements to safety and which are able to deal properly with the environmental aspects of the works.

6.3.4 Organisation

Planning and execution of demolition work can be organised in two principal ways:

- Performed by operating / maintenance personnel from existing plant operations/maintenance personnel working in the established plant organisation
- Performed by personnel wholly or partly dedicated to the organisation for the demolition work

Selection between the two alternatives would normally be based on:

- Local knowledge of the plant
- Extent of demolition work
- Complexity of demolition work
- Current work load for operations personnel

Generally, small demolition work would be executed within an existing plant organisation, whilst larger and more complex demolition work would be executed by establishing a dedicated organisation.

For execution of big and complex demolition work by a dedicated organisation some important issues must be taken into account when organising the project team:

- The team need in-depth knowledge of plant history, available documentation, knowledge about previous production processes, etc.
- Capability of systematic planning and evaluation of all related costs and risks according to the general requirement of Yara, i.e. capability of performing the works according to the same standards as for any other investment activities.
- Capability of utilising external contractors according to the same standards as for any other investment project, i.e. focus and competence on competitive bidding processes, contractor qualifications and track records (safety), contract quality.
- Availability of personnel with proper technical competence as well as continuity in the team during this phase.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

 Need for YPNPL to maintain and continuously update experience in demolition works.

The above requirements can be met by various project organisation models and utilisation of personnel.

An example is shown in Attachment 2.

6.3.5 Legislation and other requirements

An important basis for planning is to clarify national and local legislation and requirements.

For Yara's best practices for closing down, dismantling, demolition and disposal of production plants please refer to section 11 for minimum references that are going to be considered.

6.3.6 Care and Maintenance (C&M) plan

Note that any relevant environmental monitoring under Ministerial Statement shall be continued and in particular groundwater monitoring (condition 8).

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.3.6.1 Unplanned Closure

Should the TANPF be suddenly shut down there will be little or no preparation and planning period and the following are considered to pose significant environmental risks:

Environmental Risk	Closure strategy	Timing	Responsible
Liquid ammonia	Empty all pipes and vessels	<1 week	Plant manager
Nitric acid	Consolidate all nitric acid in the main storage tanks	<1 week	Plant manager
Ammonium nitrate	Consolidate all ammonium nitrate solution in the main storage tank. If air conditioning of bulk storage is in operation TAN can be kept in storage, if not the bulk should be emptied and product sold to customers. Bagged product is sold or kept in storage. If possible off-spec product is bagged and stored away from final product.	<1 week or <1 month if full storage needs to be bagged	Plant manager
Dangerous goods	Drain all pipes and consolidate fluids into storage tanks which are bunded and stored safely in an area where damage by weather events (including cyclones) is not possible.	<1 week	Plant manager
	Keep all stored lubricants, fuels, additives, coatings and solvents according to standard operational practices and procedures. Ensure storage is in an area where damage by weather events (including cyclones) is not possible	Ongoing	Plant manager
Hydrocarbons	Ensure adequate supplies of diesel are stored on Site (in appropriately constructed and bunded vessels) for continued operation of power supply generators	Ongoing	Plant manager
	Do not remove lubricating oils from rotating equipment. Keep this equipment well maintained and free from leaks	Ongoing	Plant manager
Ponds	Keep contaminated storm water system operational and maintain evaporation ponds during closure period.	Ongoing	Plant manager
Sewage system	Keep operating to standard operating specifications	Ongoing	Plant manager

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.3.6.2 Temporary closure

Should the TANPF be temporarily shut down and placed in care and maintenance the following environmental risks shall be considered:

Environmental	Closure strategy	Timing	Responsible
Risk	Closure strategy	Tilling	Responsible
Liquid ammonia	Empty all pipes and vessels and put under nitrogen atmosphere	<1 week	Plant manager
Nitric acid	Empty storage tanks and sell nitric acid	<2 week	Plant manager
Ammonium nitrate	Empty ammonium nitrate solution storage tank by selling solution to clients. Empty the TAN bulk and bag storage (deliver to customers). Off-spec product shall be bagged and removed from site for special treatment.	<1 month	Plant manager
Dangerous goods	All vessels, piping and equipment to be thoroughly cleaned, as far as practicable, free from dangerous goods and dispose of in an approved DGs disposal facility	<1 month	Plant manager
Hydrocarbons	Keep all stored lubricants, fuels, additives, coatings and solvents according to standard operational practices and procedures. Ensure storage is in an area where damage by weather events (including cyclones) is not possible	Ongoing	Plant manager
	Reduce warehouse stock levels so that only the minimum amount of lubricants, fuels additives, coatings and solvents required to keep equipment exercised, are kept on Site	Ongoing	Plant manager
	Ensure adequate supplies of diesel are stored on Site (in appropriately constructed and bunded vessels) for continued operation of power supply generators	Ongoing	Plant manager
	Do not remove lubricating oils from rotating equipment. Keep this equipment well maintained and free from leaks	Ongoing	Plant manager
Ponds	Keep contaminated storm water system operational and maintain evaporation ponds during closure period.	Ongoing	Plant manager
Sewage system	Keep operating to standard operating specifications	Ongoing	Plant manager

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.3.6.3 Planned Final Closure

After the decision has been taken to close the Plant an evaluation of possible relocation or reuse of equipment, materials and systems is done. A status report is made and based on this the decision for salvage is taken. The next step is then to develop a detailed report for adequate preservation to maintain the physical integrity of equipment. After proper cleaning, preservation is done according to vendor's recommendation and/or YPNPL experience from previous projects and all preservation activities are recorded.

Following the decision to decommission the Plant, there are certain environmental obligations to be met. An environmental audit of the Site is carried out to identify environmental risks associated with the decommissioning. A care and maintenance plan for the plant and equipment on Site as described above as well as for the management of environmental aspects of the Site is developed to follow-up and meet environmental obligations. The risks identified in the audit are managed in the C&M plan which will:

- Identify and prioritize system required during C&M.
- Assess the facility environmental monitoring system requirements.
- Rationalize examinations, inspection, maintenance and testing activities.
- Consider activities to minimize waste/ pollution during this period
- Assess resources required during this period
- · Help identify project risks.

The C&M plan shall demonstrate that the environmental obligations will be met during the decommissioning period. An ongoing requirement to continue monitoring the environment to ensure that the closure was successful and that any continuing environmental impacts are within acceptable limits. There may also be a requirement to conduct remedial work should closure targets not be reached within an acceptable timeframe. Details about activities to be performed as part of the C&M plan and mitigating measures are given in the table below and in attachment 1.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

Monitoring	Closure strategy	Timing	Responsible
Erosion	TBA	TBA	TBA
Dust	TBA	TBA	TBA
Water quality	TBA	TBA	TBA
Vegetation and flora	ТВА	TBA	TBA
Weeds	ТВА	TBA	TBA
Fauna	ТВА	TBA	TBA
Photographic record	ТВА	TBA	TBA
Fire management	ТВА	TBA	TBA
Rehabilitation maintenance	TBA	ТВА	ТВА
Remedial action	ТВА	TBA	TBA
Reporting	ТВА	TBA	TBA

Note: TBA – to be determined during final decommissioning plan

The requirement for this ongoing management and monitoring ceases once the Site lease is relinquished.

6.3.7 Dismantling

Conventional plant and buildings will be removed and demolished using standard construction industry methods. The interior of buildings will be removed first and decontaminated if necessary prior to demolition of the buildings themselves. Large or heavy equipment are going to be cut or split into components or sub-component parts prior to their removal. It is expected that after removal is complete, demolition will be carried out using conventional methods. All buildings will be demolished in their entirety, the structures including any cabling removed to ground level and the voids backfilled. Once removed, the footprints of buildings will be backfilled. Any remaining below ground building structures (e.g. basements will be punctured to prevent 'ponding' (accumulation of water).

Equipment and piping will be dismantled and removed and the metal recycled.

All suitable demolition material from buildings will be retained on-site to be used for the backfilling of deep voids.

It will also be considered involving a professional second hand dealer and demolition contractor in this process.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

Potential solid waste materials that will be created during decommissioning of the YPNPL Plant are (but not limited to):

- Insulation.
- Cabling (copper will be recovered).
- Piping (to be recycled).
- Equipment (to be recycled).
- Concrete.
- Asphalt.
- Rubber (belt conveyors).
- Gaskets.
- Catalysts (to be recovered and recycled)
- Buildings structures
- Prill tower skirts (fabric).
- Glass from windows.

Some instruments will contain radioactive substances and these will be handled in accordance with relevant legislation and YPNPL's waste management plan previously defined.

Non-hazardous waste materials that need to be handled during decommissioning of the YPNPL Plant are (but not limited to):

- Oil (from compressor and other equipment with lubrication).
- Sludge (from cleaning from ponds).

6.3.8 Demolition and disposal of material

The following needs to be considered in connection with demolition of civil and structural material:

- Definition of the demolition scope and disposal works.
- Mapping and analysis of all chemical, toxic and polluting materials above and below ground, and the magnitude of such. It will be beneficial in this respect to:
 - Know the history of the facility throughout its lifetime
- How to handle the above in view of:
 - Legislation
 - Yara's directives and procedures
- A plan for approval of handling and disposal of chemical, toxic and polluting material.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

- Documentation for structures, foundations, piles, pipe racks, conduits for cables, sewage and other underground installations.
- Possible methods for demolition.
- How to dispose of the waste material:
 - Unsorted.
 - Sorted as for instance as:
 - Clean concrete which can be crushed and recycled (backfill), steel and other metal scrap which can be recycled.
 - II. Reusable material (doors, windows, roof tiles etc.).
 - III. Polluted material for disposal in approved storage.
 - IV. Polluted and toxic material for destruction.
- A plan for transport of waste material.
- Stability of concrete and steel structures during demolition:
 - Need for temporary support.
 - o Permanent support if only parts of structures shall be removed.
- · Replacement of contaminated soil.
- Termination and/or rerouting of connections to outside battery limit installations.
- Safety and health:
 - Personal protection, also against toxic material.
 - Fencing and entrance control to the site.
- A schedule for these activities according to the execution of the works
- Documentation of the Site's status when the works have been completed.

6.3.9 Decontamination and management of noxious materials following closure

Decommissioning activities will also involve removal of contaminants (decontamination) from equipment and piping as well as liquid waste storages and buildings. The objective of decontamination activities is to

- Reduce/eliminate the environmental exposure
- Ensure safe dismantling of the facility
- Salvage the facility, equipment and materials as far as possible
- Restore the Site for future use (which may be different)

11-05-2015 500-200-PLN-YPN-0001 Rev 6

A structured decontamination process is carried out in multiple stages, each stage resulting in equipment progressively reaching a clean status. The different stages are:

- 1. Primary decontamination This is the initial cleaning of equipment and the main purpose is to reduce occupational exposure.
- 2. Dismantling The equipment is dismantled and checked for cleanliness. The equipment can now be inspected and evaluated for possible future use.
- 3. Secondary decontamination In some cases dismantled equipment needs further cleaning for safety reasons or depending on future use.
- 4. Disposal of equipment The equipment is ready for disposal; it can be relocated, sold or scrapped.
- 5. Disposal of waste The decontamination process generates liquid and/or solid waste that needs to be disposed of in a systematic manner and according to regulations. The waste disposal process often requires the involvement of specialized companies.

When selecting the decontamination process requirements like safety, efficiency, cost-effectiveness, waste minimization and feasibility must be considered.

The TANPF produces ammonium nitrate as a raw material for mining explosives. Ammonium nitrate is basically a fertilizer made from ammonia and nitric acid and is classified as an oxidizer. According to the Dangerous Goods (DG) license the TANPF has the following DG inventory:

Anhydrous ammonia - Nitric acid - Ammonium nitrate - Diesel - Nitrogen - Hydrogen - Nitrogen oxides - Nitrous oxide - Oxygen scavenger (Elim-Ox) - Trisodium phosphate - Ammonia oxidation catalyst - DeNOx catalyst - DeN₂O catalyst - Hydraulic lube oil - Hydrochloric acid - Caustic soda - Sodium hypochlorite - Sodium metabisulphite - Corrosion inhibitor (Nalco Trac-100) - Sulphuric acid - Methanol - Karl Fisher reagent.

Regarding DG inventory – all vessels, piping and equipment shall be thoroughly cleaned as far as practicable, to be free from DG material and disposed of in an approved DGs disposal facility.

In addition to these DG chemicals the operation is also utilizing a coating agent (oil/wax based) and an organic internal additive (sulphonate) as well as an inorganic internal additive (aqueous solution of diammonium phosphate, ammonium sulphate and boric acid) for product quality improvement.

Raw material for the production of TAN is ammonia, nitric acid (intermediate) and coating agent and internal additive. Most of the above chemicals are stored on site in limited amounts (IBC) and are used for water treatment, corrosion inhibition and neutralization of effluents to storage ponds. The gases listed above are generally stored in cylinders and mainly used for calibration of analyzers.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

If possible the nitric acid in the storage tanks will be consumed before stopping the operation as will be the case for AN solution. AN solution in the storage tank can also be delivered to customers (for emulsion production). Ammonia handling equipment and pipelines will also be emptied and then flushed to ensure there is no ammonia left.

After final closure of the operation all unused chemicals will be returned to the various vendors. Opened bottles/drums/IBC's etc. that cannot be returned to vendors will be treated as special waste and disposed of according to regulations.

After nitric acid equipment, piping and tanks have been emptied a specialized company will be engaged to recover platinum catalyst from heat exchangers and vessels. The platinum catalyst deposit represents a significant amount of money and destructive as well as non-destructive techniques will be applied depending on possible later use or scrapping of the equipment. The used DeNOx (Vanadium pentoxide) as well as DeN_2O catalysts do not represent any residual value and will be removed from DeNOx reactor and ammonia oxidation reactor and disposed of according to regulations.

AN equipment, piping and tanks will, after emptying, be flushed to remove any deposits. This is to ensure safe dismantling in case hot work is applied as well as to ensure no AN contaminated items sold to any third party. The liquid used for flushing will be collected in the contaminated water ponds (for later removal).

The diesel storage tanks as well as the lube oil skid for the compressor train will be emptied by a certified company and any fluid reused or disposed of according to regulations.

There are two evaporation ponds for contaminated water on Site. After these ponds have been emptied (by evaporation and pumping), any sludge and sediments (which will mainly be contaminated with nitrate) will be collected and disposed of according to regulations. These ponds are designed with double bottom and leak protection and the potential for contaminated soil below the ponds is minimal.

6.3.10 Schedule

Experience shows that it is important to allow for enough time to plan, clean, dismantle and prepare the site before the execution of final demolition by contractor(s).

For schedule purposes it is important to note that experience shows that it often takes longer than one would expect to dispose of all sellable material and equipment.

A master schedule shall be based upon schedules for the different main activities, and milestones that are going to be given. This is useful for the interfaces with other parts of the Site or Plant.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.3.11 Risks

This type of activities need careful evaluation of the risks and how to deal with each of the risk factors related to:

- environment/pollution
- safety and health
- stability of structures during demolition
- schedule
- contracts
- cost
- income from sale of equipment

Risk reduction and risk avoidance must be evaluated.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

6.4 Execution Phase

When budget and schedule have been approved for the dismantling and demolition works, a dedicated project team needs to be formed to execute and control the activities.

The team need to have competence to cover the following:

- Project management and project control
- Procurement (and sale for sellable equipment and material)
- Operational issues (documentation, history, temporary arrangements)
- Civil and structural
- HSE issues

The main tasks for the project team will be to execute the activities according to the plans, schedule and budget which have been prepared in the planning phase, or even improve compared to this.

An important issue in this phase is to control the risks. Risks in such activities are mainly related to:

- HSE
- Stability of structures
- Cost

Analysis, response to and control of these items are essential.

For HSE, specific plans and applicable procedures have to be established. Cooperation and communication with involved contractors is important in order to get an understanding of the issue and the response YPNPL has taken to reduce the risks. Follow up closely and implement corrective actions without hesitation.

During demolishing, stability of remaining structures has to be continuously assessed. Control of the risk has to be done by involving competent personnel.

The Site will be brought back to a level of an industrial zoned area. Specific control measures will be used to guide the management of water resources, landforms, revegetation and infrastructure and support facilities during decommissioning. If a contamination issue is identified before or during the closure, specific closure actions will be included in the plan. In addition, equipment, buildings and other facilities will be removed. Surface water ponds will be emptied and cleaned (with any contaminated waste to be appropriately removed by an approved waste contractor). Interconnections (piping) with YPFPL will be removed.

Decommissioning would entail similar noise sources to those expected during the construction of the plant, i.e. cranes, trucks for removal of material, and earthmoving equipment. Typical noise impacts would be as for the construction phase. Additional likely noise sources would include rock-breaker equipment to break up concrete foundations. No significant impact is expected at any sensitive receptor.

11-05-2015 500-200-PLN-YPN-0001 Rev

Emissions associated with decommissioning include equipment removal and site rehabilitation. Emissions will be controlled through the implementation of an environmental management plan. As such, emissions are anticipated to be small in magnitude.

Potential waste materials are going to be generated during decommissioning of the YPNPL. This will likely include grey water, waste oils and other and non-specified liquid wastes.

The construction and operation of the YPNPL is not expected to generate large volumes of solid waste. During decommissioning activities there will be significant quantities of solid waste.

All hazardous wastes will be managed by contractors who hold the appropriate Carrier's License, which will be checked for current validity before a contract is placed and implemented. The specific contractor used will depend on the type of waste requiring disposal. All records are auditable and will be checked regularly.

In general, the management of waste at YPNPL will aim to minimize the need to use landfill by reducing waste volumes wherever possible by following the hierarchy of waste management, i.e. reduce, reuse, and recycle. YPNPL follows the Environmental Protection Act 1986 principles for all waste arising and where waste is transferred, it is accompanied by a transfer note and a full written description of the wastes.

Scrap metal (e.g. steel and copper) and glass will be sent to an appropriate contractor for recycling. If it is not practicable to reuse or recycle any scrap materials they will be disposed of via approved routes.

Effluent will be disposed in accordance with YPNPL's discharge consents under the Water Resources Act. Discharges under these consents include cooling water, rain water and fully treated effluent from the site sewage treatment plant.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

7 Mitigation Measures

There are no specific changes to the mitigation measures that were submitted in the Environmental Statement and reported in the Construction Environmental Management Plan.

Mitigation measures already identified for the care and maintenance preparations & activities can be considered in Attachment 1.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

8 Stakeholders Engagement

Whilst decommissioning represents a new phase in the lifecycle of the site, YPNPL remains committed to engaging with stakeholders at all phases in the process. Regular meetings have been and will continue to be held with the Site Stakeholder Group as well as environmental agency, local authorities, etc. that will also be kept informed of activities at the Site. Organizations will be also involved in the public consultation process for the Environmental Statement. As well as regular meetings with stakeholders, where appropriate, other interested parties will also be kept informed of specific decommissioning activities.

11-05-2015 500-200-PLN-YPN-0001 Rev 6

9 Documentation

When the Site has been cleared, final documentation has to be prepared.

The main reason is to document towards Australian Authorities and future users of the Site the status of the cleared Site and how the toxic and contaminated materials have been disposed of and who presently has the responsibility for it.

Such documentation will consist of:

- Demolition Contract Evaluation Report
- Demolition Contract
- Lists/receipts from receiver of all demolition materials
- Final (as-built) layout drawings indicating remaining structures in the ground
- Final (as-built) layout drawings indicating any remaining contamination in the ground
- Final accounts, reports etc.

11.1 Attachment 1: Mitigation Measures

Environmental Impact	Mitigation measure	Action	Comments
Air quality & dust			
Dust Emissions (from on-site) ☐ Increase in site dust emissions due to construction, demolition and waste / materials handling operations, etc. which could impact on residential and industrial receptors.	The following best practice measures will be implemented as appropriate: On-site roads to be regularly cleaned of mud/dust deposits, including the use of re-circulating water wheel washers and road cleaners as appropriate; and sheeting of vehicles carrying potentially dusty loads; Minimization of unnecessary material and waste handling as far as practicable; Use of water sprays for external demolition activities as appropriate; Use of water sprays during outside in-fill operations; Avoidance of vehicular use of unsurfaced (soft) ground where possible and limits on vehicle speeds on such surfaces where it cannot be avoided; Use of water sprays during particularly windy or dry conditions; Use of water sprays to maintain	Routine control will be enforced through existing site procedures. Any additional requirements will be considered as part of the environmental, health and safety justification produced as part of individual decommissioning working plans. The effectiveness of dust mitigation will be monitored. There are a variety of means of measuring dust deposition; directional monitoring will be used if possible. It is appropriate to initiate monitoring before works commence in order to determine the background contribution to which the site need to add. Arrangements will be discussed and agreed in advance with the local authority as necessary.	These mitigation measures primarily concern impacts on humans. However, their implementation will also offset possible impacts of dust deposition on sensitive habitats immediately adjacent to the site.

Environmental Impact	Mitigation measure	Action	Comments
Dust Emissions (road side from vehicles) Increase in dust at residential properties along traffic routes due to soiled vehicles or vehicles carrying dust loads.	damp surfaces during dry and windy weather (e.g. soil stockpiles, demolition rubble); or sheeting or seeding of surfaces of stockpiles of soil or other dusty materials; Sheeting or seeding of surfaces and/or use of wind fences; and Covering of containers and/or use of wind fences. As appropriate: Sheeting of lorries carrying dusty loads; and Provision of wheel and body washing where appropriate for, as a minimum, heavy goods vehicle leaving the site.	□ Routine control will be enforced through existing site procedures. Any additional requirements will be considered as part of the environmental, health and safety justification produced as part of individual decommissioning working plans. □ These mitigation measures will be considered as part of the development of the Transport Management Plan.	These mitigation measures primarily concern impacts on humans and aim to reduce the potential for complaints associated with fugitive dust.

Environmental impact

Additional mitigation measures (or any changes required to those measures listed above) for activities during final site clearance will be based on the technologies available at that time, decommissioning experience and any future environmental assessment deemed necessary. In particular, repeat ecology and traffic checking, the protected aboriginal heritage, flora, fauna and weed species, prior to final site clearance are proposed followed by a reconsideration of the appropriate mitigation measures.

11-05-2015 500-200-PLN-YPF-0001 Rev 6

11.2 Attachment 2: Potential Organisational Chart for Decommissioning Activities

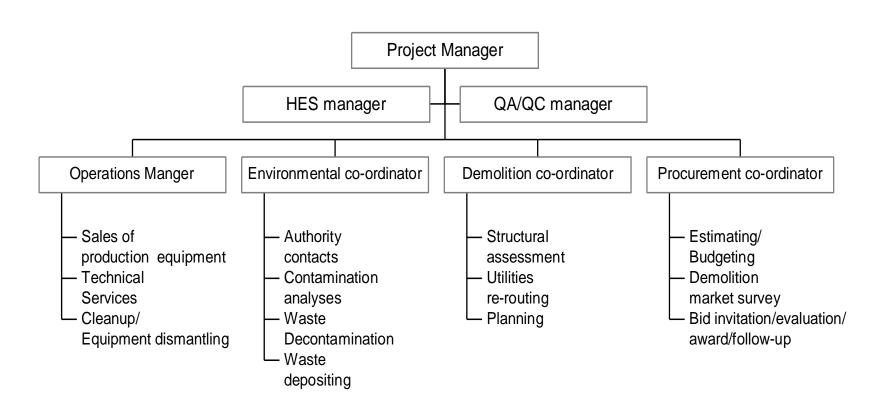

Note: This attachment must be read in connection with item 8.1.3 in the manual.

The below organisation chart is an example designed to cover the following requirements:

- Need for in-depth knowledge in the project team of plant history, available documentation, knowledge about previous production processes etc.
- Capability of systematic planning and evaluation of all related costs and risks according to the general requirement of Yara, i.e. capability of performing the activities according to the same standards as for any other investment projects.
- Capability of utilising external contractors according to the same standards as for any other investment project i.e. focus and competence on competitive bidding processes, contractor qualifications and track records (safety), contract quality.
- Availability of personnel with proper technical competence as well as continuity in the project team during the works.
- Need for Yara to maintain and continuously update experience in demolition projects

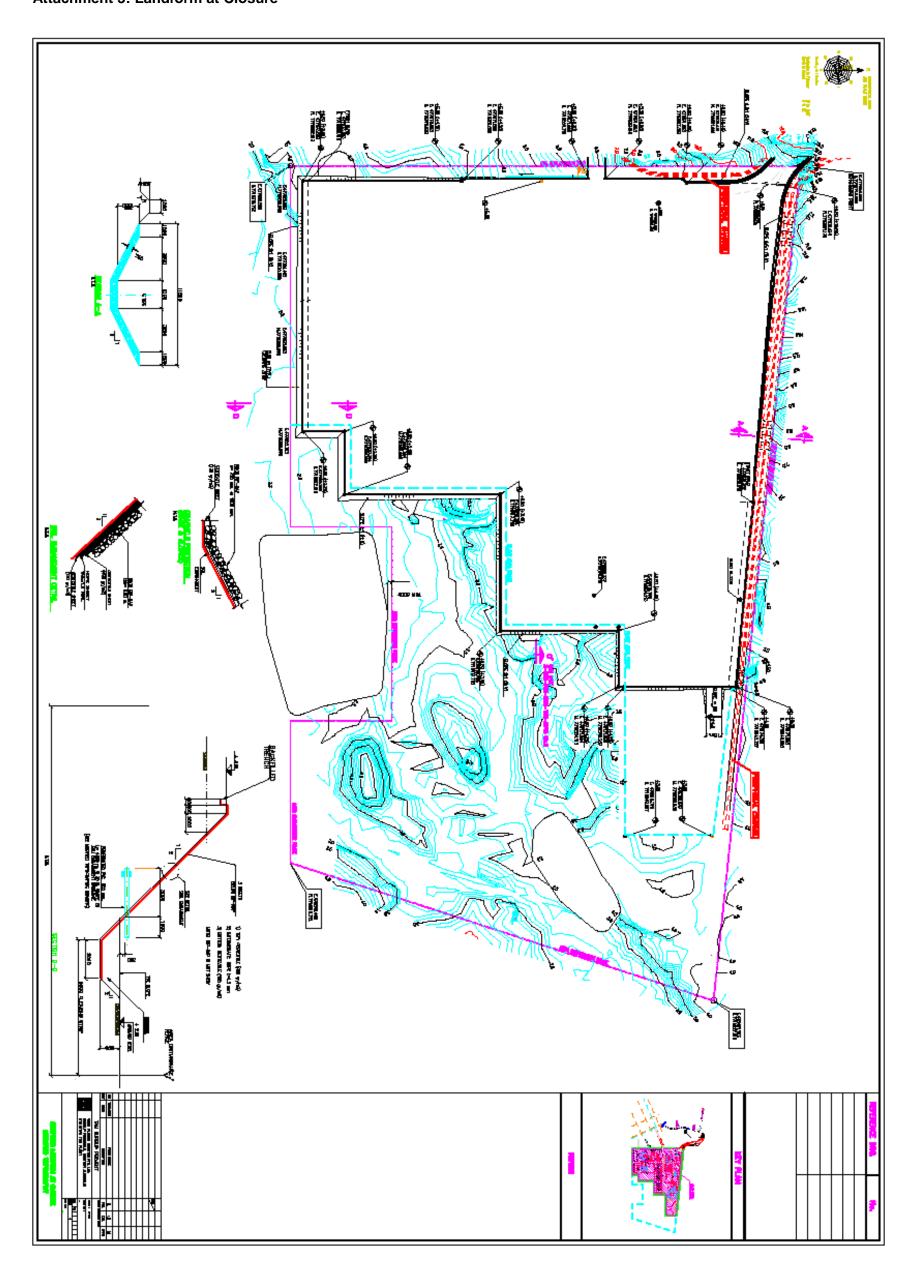

The organisation chart would be applicable for major demolition projects, where the demolition waste includes contaminated fractions and where the operations organisation is being dissolved as part of the restructuring/closing of current operations. The model is based on the condition that certain key personnel from operations be retained and not given new tasks until the demolition project has been completed.

Attachment 10B

Letter from OEPA, dated 23 October 2015, approving the DEMP Revision 6.

Mr Rajan Sinha Technical Services & Business Development Manager Yara Pilbara Nitrates Pty Ltd Level 5, 182 St Georges Terrace PERTH WA 6000 Our Ref: 2015-0001138042; AC05-2014-0074

Enquiries: John Güld, 6145 0853 Email: john.guld@epa.wa.gov.au

Dear Mr Sinha

TECHNICAL AMMONIUM NITRATE PRODUCTION FACILITY - MINISTERIAL STATEMENT 870 - DECOMMISSIONING ENVIRONMENTAL MANAGEMENT PLAN

Thank you for your letter of 11 May 2015 submitting the Decommissioning Environmental Management Plan (Doc Ref: 500-200-PLN-YPN-0001, Rev 06) to the Office of the Environmental Protection Authority (OEPA) for review.

I note the Decommissioning Environmental Management Plan has been prepared to satisfy condition 10-1 of Ministerial Statement 870

I am satisfied with the preparation of the Decommissioning Environmental Management Plan (Doc Ref: 500-200-PLN-YPN-0001, Rev 06), and consider the requirements of condition 10-1 of Ministerial Statement 870 have been met.

Please note any changes to the management actions or targets of the Decommissioning Environmental Management Plan (Doc Ref: 500-200-PLN-YPN-0001, Rev 06) would require the approval of the OEPA.

Yours sincerely

Mr Kim Taylor

GENERAL MANAGER
